Inflammatory drugs (MSAIDa)

Inflammatory drugs (MSAIDa)

Research (MSAIDa)

Precautions (5.1)].
Meloxicam tablets are contraindicated in the setting of coronary artery bypass graft (CABG) surgery [see Contraindications (4) and Warnings and Precautions (5.1)].

Warnings and Precautions (5.1) [.
Statistication Blaceding, Ulceration, and Perforation

• NSAIDs cause an increased risk of serious gastrointestinal (cl)
adverse events including bleeding, ulceration, and perforation of the
stomach or intestines, which can be fatal. These events can occur at
and patients with a prior history of peptic licker disease and/or Gi
bleeding are at greater (risk for serious Gi events [ see Warnings and
Precautions (5.2)].

1 INDICATIONS AND USAGE

1.1 Osteoarthritis (OA)

Meloxicam tablets are indicated for relief of the signs and symptoms of osteoarthritis [ see Clinical Studies (14.1)].

1.2 Rheumatoid Arthritis (RA)

Meloxicam tablets are indicated for relief of the signs and symptoms of rheumatoid arthritis [see Clinical Studies (14.1)].

1.3 Juvenile Rheumatoid Arthritis (JRA) Pauciarticular and Polyarticular Course Meioxicam tablets are indicated for relief of the signs and symptoms of pauciarticular or polyarticular course juvenile Rheumatoid Arthritis in patients who weigh  $\succeq$ 60 kg [ see Dosage and Administration (2.4) and Clinical Studies (14.2) ].

2 DOSAGE AND ADMINISTRATION 2.1 General Dosing Instructions

Carefully consider the potential benefits and risks of Meloxicam tablets and other treatment options before deciding to use Meloxicam tablets. Use the lowest effective dosage for the shortest duration consistent with individual patient treatment goals (sr Warnings and Precautions (5)].

After observing the response to initial therapy with Meloxicam tablets, adjust the dose to suit an individual patient's needs.

Meloxicam tablets may be taken without regard to timing of meals.

For the relief of the signs and symptoms of osteoarthritis the recommended starting and maintenance oral dose of Meloixiam tablets is 7.5 mg once daily. Some patients may receive additional benefit by increasing the dose to 15 mg once daily.

### 2.3 Rheumatoid Arthritis

For the relief of the signs and symptoms of rheumatoid arthritis, the recommended starting and maintenance oral dose of Meloxicam tablets is 7.5 mg once daily. Some patients may receive additional benefit by increasing the dose to 15 mg once daily.

### 2.4 Iuvenile Rheumatoid Arthritis (IRA) Pauciarticular and Polyarticular Course

For the treatment of juvenile rheumatoid arthritis, the recommended oral dose of Mebxicam tablets is 7.5 mg once daily in children who weigh  $\geq$  50 kg. There was no additional benefit demonstrated by increasing the dose above 7.5 mg in clinical trials Meloxicam tablets should not be used in children who weigh <60 kg.

### 2.5 Renal Impairment

The use of Meloxicam tablets in subjects with severe renal impairment is not recommended

In patients on hemodialysis, the maximum dosage of Meloxicam tablets is 7.5 mg per day [ see Clinical Pharmacology ( 12.3) ].

## 2.6 Non-Interchangeability with Other Formulations of Meloxicam

Meloxicam tablets have not shown equivalent systemic exposure to other approved formulations of oral meloxicam. Therefore, Meloxicam tablets are not interchangeable with other formulations of oral meloxicam product even if the total miligram strength is the same. Do not substitute similar does strengths of Meloxicam tablets with other formulations of oral meloxicam product.

### 3 DOSAGE FORMS AND STRENGTHS

- A USANCE FORMS AND STREMULTS

  7.5 mg: Light yellow, round flat beveled edged, tablet with U & L debossed on one side and 7.5 debossed centrally on the other side

  1.5 mg: Light yellow, capsule shaped, biconvex, tablet with U & L debossed on one side and 1.5 debossed centrally on the other side

### 4 CONTRAINDICATIONS

- Mebxicam tablets are contraindicated in the following patients:

  Known hypersenstivity (e.g., anaphylactic reactions and serious skin reactions) to mebxicam or any components of the drug product [see Warnings and Precautions (5.7, 5.9]]
- 5.7.5.9.9 I shtma, urticaria, or other allergic-type reactions after taking aspirin or other KSAIDs. Severe, sometimes fatal, anaphylactic reactions to NSAIDs have been reported in such patients | see Warnings and Pre-audions (5.7.5.8) | in the setting of coronary artery bypass graft (CABG) surgery (see Warnings and Precautions (5.2.1)

5 WARNINGS AND PRECAUTIONS
5.1. Cardiovascular Thrombotic Events
Clinical trius of several CDK2 selective and nonselective NSAIDs of up to three years duration have shown an increased risk of serious conflower.Cular (CV grown backer of the conflower.Cular CV grown backer of the conflower. The conflower conflower.Cular CV grown backer of the conflower of the conflower. CV grown backer of the conflower of the conflower. AND occurred in a paper suriately 15 or plants treated for 3-6 months, and in about 2-4% or plants treated for 3-6 months, and in about 2-4% or plants in treated for 3-6 months, and in about 2-4% or plants in treated for one year. However, even short-term MSAID therapy is not

whithout risk.

# Risk Factors for GI Bleeding, Ulceration, and Perforation

Bak Extoris for GI Bleeding, Liberation, and Perforation

Patterns with a prior history of profet, used disease and/or GI bleeding who used NSAIDs

Patterns with a prior history of profet, used disease and/or GI bleeding who used NSAIDs

without these risk factors. Other factors that it exceps the risk of GI bleeding in palants

without these risk factors, other factors that it exceps the risk of GI bleeding in palants

restead with NSAIDs include longer duration of NSAID therapy, concomitant use of oral

controctorious, appir, anticoagulants, or selective serotomir exceptive inhibitors

postmarketing reports of failed Glevering or delivery of selbilated palants.

Additionally, patients with advanced liver disease and/or coagulapathy are all increased

risk for GI bleeding.

Strategies to Minimize the GI Risks in NSAID-treated patients:
 Use the lowest effective dosage for the shortest possible duration.

- Use the lowest effective dosage for the shortest possible duration.
   Avoid administration of more than one NSAID at a time.
   Avoid use in patients at higher risk unless benefits are expected to outweigh the increased risk of bleeding. For such patients, as well as those with active GI bleeding, consider alternate therapies other than NSAIDs.
   Remail alter for signs and symptoms of GI ulcreation and bleeding during NSAID
- therapy.

  If a serious GI adverse event is suspected, promptly initiate evaluation and treatment, and discontinue Meloxicam until a serious GI adverse event is ruled out.

  In the setting of concomitant use of low-dose applyin for cardiac prophylaxis, monitor patients more closely for evidence of GI bleeding [ see Drug Interactions ( 7) ].

Bevaitions of ALT or AST (three or more times the upper limit of normal [ULN]) have been reported in approximately 1% of NSAID-treated patients in clinical trials. In addition rare, sometimes fatal, cases of severe hepatic hjury, including fulminant hepatits, iver necrosis, and hepatic failure have been reported.

Elevations of ALT or AST (less than three times ULN) may occur in up to 15% of patients treated with NSAIDs including meloxicam.

Inform patients of the warning signs and symptoms of hepatotoxicity (e.g., nausea, fratigue, lethrary, durinder, porture), numider, pilty upger quadrant tendencies, and Thu-like's symptoms). If clinical signs and symptoms consistent with twe disease develop, or a systemic mamefactation soccur (e.g., exisonsphila, rank, etc.), discontinue Helboxcam immediately, and perform a clinical evaluation of the patient [ see Use in Specific Populations (6.9) and Clinical Pharmatoxogy (12.3)].

NSAIDs, including Mebxicam, can lead to new onset or worsening of preexisting hypertension, either of which may contribute to the increased incidence of CV events. Patients taking anothers in convertience enzyme (ACE) highbors, thiszaked univertes, or loop durects may have impaired response to these therapies when taking NSAIDs [see Drog Interactions (7)].

Monitor blood pressure (BP) during the initiation of NSAID treatment and throughout the course of therapy.

S.S. Heart Failure and Edema
The Coxib and traditional MSAID Trailests Collaboration meta analysis of randomized controlled trials demonstrated in approximately two-fold furchase in hospitalizations for heart failure in COX-2 selective-treated patients and nonselective MSAID-treated patients compared to placebor-treated patients. In a Basish National Repity study of patients with heart failure, MSAID use increased the risk of MI, hospitalization for heart failure, and death.

Additionally, fluid retention and edema have been observed in some patients treated with NSAIDs. Use of meloxicam may blunt the CV effects of several therapeutic agents used to treat these medical conditions (e.g., duretics, ACE inhibitors, or angiotensin receptor blockers [ARBs]) [ see *Drug Interactions* (7)].

Avoid the use of Meloxicam in patients with severe heart failure unless the benefits are expected to outweigh the risk of worsening heart failure. If Meloxicam is used in patients with severe heart failure, monitor patients for signs of worsening heart failure.

### 5.6 Renal Toxicity and Hyperkalemia

Renal Toxicity

Renal Toxicity

Long-term administration of NSAIDs, including Meloxicam, has resulted in r necrosis, renal insufficiency, acute renal failure, and other renal injury.

Renal toxictly has also been seen in patients in whom renal prostaglandins have a compensatory role in the maintenance of renal perfusion. In these patients, administration of an SAUD may cause a dose-dependent reclution in prostaglandin maintenance of the SAUD may cause a dose-dependent reclution in prostaglandin decompensation. Patients at greatest risk of this reaction are those with impaired renal function, dehystration, hypovolemia, heart failure, but of systemiction, those tasking duretics and ACE inhibitors or ABIS, and the delety. Discontinuation of NSAID therapy is usually followed by recovery to the pretentient state.

The renal effects of Meloxicam may hasten the progression of renal dysfunction patients with preexisting renal disease. Because some Meloxicam metabolites a excreted by the kidney, monitor patients for signs of worsening renal function.

I. No information is available from controlled clinical studies regarding the use of Meloxicam in patients with advanced renial disease. Avoid the use of Meloxicam in risk of Meloxicam is used in risk of worsening renial function. If Meloxicam is used in patients with advanced re disease, monitor patients for signs of worsening renal function [see Clinical Pharmacology (12.3)].

rnamme.cogy (12.3); !https:rdaimal Increases in serum potassium concentration, including hyperkalemia, have been reported with use of NSAIDs, even in some patients without renal impairment. In patients with normal renal function, these effects have been attributed to a hyporelmenter-hypododesteroims in service.

Nebuckan has been associated with anaphylastic reactions in patients with and without known hypersensibly to medicine and in patients with apprin-sensible asthma [see Contraindications (4) and Warnings and Precautions (5.8)].

See Secure patients of Asthman Related to Asphrin Sensibility.

A subpopulation of patients with asthman may have appire sensible asthman which may necessary to the substance of the controlled control inhomosulasts complicated by makeal plops; seever potentially fattal bronchospam; and/or intolerance to asphrin and other KSAUDs. Because cross-rectivity between asphrin and other KSAUDs has been reproduct in such asphrin-ensible patients, Metoxican is contrained cated in patients with this form of appirs nestably patients, Metoxican (4). When Metoxican is used in patients with pre-existing asthman (without toront appirs sensibley), monitor patients for changes in the signs and symptoms of azilance.

## 5.9 Serious Skin Reactions

Local Control of the Control of the

5.10 Drug Reaction with Iosinophila and Systemic Symptoms (DRESS)
Trug Reaction with Eosinophila and Systemic Symptoms (DRESS) has been reported in
patients saking RSAIDs such as meloxicum. Some of these events have been failed or if
patients saking RSAIDs such as meloxicum. Some of these events have been failed or if
why melocome of the second of th

## 5.11 Fetal Toxicity

### Premature Closure of Fetal Ductus Arteriosus

Avoid use of NSAIDs, including meloxicam, in pregnant women at about 30 weeks gestation and later. NSAIDs, including meloxicam, increase the risk of premature closure of the fetal ductus arteriosus at approximately this gestational age.

### Oligohydramnios/Neonatal Renal Impairment

Oliphotydraminis. Mennial Benal Impairment.

Use of MSAIDs, Including meloxicum, a blood 20 weeks gestation or later in pregnancy may cause fetai rend dysfunction leading to oligohydraminis and, in some cases, so weeks of treatment, although oliphydraminis has been infrequently reported as soon as 48 hours after MSAID halation. Oliphydraminis is often, but not always, reversible example, include into contractures and deleged lung maturation. In some postmarketing cases of impaired mennial renal function, invasive procedures such as exchange cases of impaired mennial renal function, invasive procedures such as exchange cases.

trainsuson or useps we re-required. 
If MSAID trainsus in secessary between about 20 weeks and 30 weeks gestation, limit in MSAID trainsus in secessary between ado shortest duration possible. Consider undexional monthoring of annitot for flief in eleoxican treatment extends beyond 48 hours. Discontinue meloxican if oligibrytrainniss occurs and follow up according to clinical practice (see Use in Specific Populations (8.1).

# 5.12 Hematologic Toxicity

Anemia has occurred in NSAID-treated patients. This may be due to occult or gross blood loss, fluid retention, or an incompletely described effect on erythropoiesis. If a patient treated with Meloxicam has any signs or symptoms of anemia, monitor hemoglobin or hematocrit.

NSAIDs, including Mebxicam, may increase the risk of bleeding events. Co-morbid NSAIDs, including Mebxicam, may increase the risk of bleeding events. Co-morbid conditions such as coagulation disorders or concomitant use of warfarin, other anticoagulatis, anothiguetied agents (e.g., aspirin), serfordin resparks inhibitors (SSRIs) and servicion inoriepitelphine reugstale inhibitors (SNRIs) grid recrease this risk. Monitor these patients for signs of bleeding [see Dring Interactions (7)].

5.13 Masking of Inflammation and Fever

The pharmacological activity of Mebxicam in reducing inflammation, and possibly fever may diminish the utility of diagnostic signs in detecting infections.

# 5.14 Laboratory Monitoring

Because serious GI bleeding, hepatotoxicity, and renal injury can occur without warning symptoms or signs, consider monitoring patients on long-term NSAID treatment with a CBC and a chemistry profile periodically [see Warnings and Precautions (5.2, 5.3, 5.6)]

The following adverse reactions are discussed in greater detail in other sections of the labeling:

• Cardiovascular Thrombotic Events [ see Boxed Warning and Warnings and Precaudions (5.1)]

- Cardiovascular Thrombotic Events | see Boxed Warning and Warnings and Precautions (5.1). Dann and Perforation | see Boxed Warning and Warnings and Precautions (5.2).

6.2 Post Marketing Experience

The following adverse reactions have been identified during post approval use of Meboxican Because these reactions are reported voluntarily from a population of uncertain size, it is not always possible to reliably estimate their frequency or establish a causal relationship to drug exposure. Decisions about whether to incube an adverse event from spontaneous reports in labeling are typically based on one or more of the causal relationship to the drug. Adverse reactions reported in worldwise post marketing experience or the iterature include: acute urinary retention; agranulocytosis; alterations in mod (such as mond devalation); anaphylatical reactions including shock erythema multiforme; exhibative dermarktis, interstitial ineprints; joundice, ber falure, Stevensjoulhours syndrome tout experience inactoryse, and inferrelly female.

# 7 DRUG INTERACTIONS

Drugs that Interfere with Hemostasis

Drugs that lifte	Here with Helilostasis
Clinical Impact:	Meloxicam and anticoagulants such as warfarin have a synergistic effect on bleeding. The concentiant use of meloxicam and anticoagulants have an increased risk of serious bleeding compared to the use of either drug alone. Serotonin release by plateless plays an important role in hemostasis. Case control and cohort epidemiological studies showed that concomitant use of drugs that interfer ewith serotonin reuptake
	and an NSAID may potentiate the risk of bleeding more than an NSAID alone.
Intervention:	Monitor patients with concomitant use of Meloxicam with anticoagulants (e.g., warfarin), antiplatelet agents (e.g., aspirin), selective serotonin reuptake inhibitors (ISSRIs), and serotonin norepinephrine reuptake inhibitors (SNRIs) for signs of bleeding [ see Warnings and Precautions (5.121) ].
Aspirin	
Clinical Impact:	Controlled clinical studies showed that the concomitant use of NSAIDs and analgesic doses of aspirin dose not produce any greater therapeutic effect than the use of NSAIDs alone. In a clinical study, the concomitant use of an NSAID and aspirin was associated with a significantly increased incidence of GI adverse reactions as compared to use of the NSAID alone [5.22].
Intervention:	Concomitant use of Meloxicam and low dose aspirin or analgesic doses of aspirin is not generally recommended because of the increased risk of bleeding I see Warnings and Precautions (5.12) ]. Meloxicam is not a substitute for low dose aspirin for cardiovascular protection.
ACE Inhibitors,	Angiotensin Receptor Blockers, or Beta-Blockers
Clinical Impact:	NSAIDs may diminish the anthypertensive effect of angiotensis converting enzyme (ACE) inhibboxs, angiotensin receptor biockers (including propranolo). In patients who are elderly, volume-depleted (including those on diuretic therapy), or have renal impairment, coadministration of an NSAID with ACE inhibbors or ARBs may result in deterioration of renal function, including possible acute renal finalure. These effects are usually reversible.
Intervention:	During concomitant use of Meloxicam and ACE Inhibitors, ARBs, or bela-blockers, monitor blood pressure to ensure that the desired blood pressure is obtained.  ACE Inhibitors or ACE Inhibitors
Diuretics	
Clinical Impact:	Emical studies, as well as post-marketing observations, showed that NSADs reduced the naturatest effect of loop durests; edg. q. furosemide) and thiazide diurets in some patients. This effect has enabled the thiazide diurets in some patients. This effect has enabled the thiazide diurets in some patients. This effect has her to the constrated as reduction in naturatest effect. Turosemide have not demonstrated as reduction in naturatest effect. Turosemide is reduced to the constraint of the cons
Intervention:	for signs of worsening renal function, in addition to assuring duretic efficacy including antihypertensive effects [ see Warnings and

	Precautions ( 5.6) ].
Lithium	
Clinical Impact:	NSAIDs have produced elevations in pissma lithium levels and reductions in renal lithium clearance. The mean minimum lithium concentration increased 15%, and the renal clearance decreased approximately 20%. This effect has been attributed to NSAID inhibiton of renal prostaglandin synthesis [see Clinical Pharmacologi [12.3]].
Intervention:	During concomitant use of Meloxicam and lithium, monitor patients for signs of lithium toxicity.
Methotrexate	
Clinical Impact:	Concomitant use of NSAIDs and methotrexate may increase the risk for methotrexate toxicity (e.g., neutropenia, thrombocytopenia, ren- dysfunction).
Intervention:	During concomitant use of Meloxicam and methotrexate, monitor patients for methotrexate toxicity.
Cyclosporine	
Clinical Impact:	Concomitant use of Meloxicam and cyclosporine may increase cyclosporine's nephrotoxicity.
Intervention:	During concomitant use of Meloxicam and cyclosporine, monitor patients for signs of worsening renal function.
NSAIDs and Sal	icylates
Clinical Impact:	Concomitant use of meloxicam with other NSAIDs or salicylates (e.g diflunisal, salsalate) increases the risk of GI toxicity, with little or no increase in efficacy [ see Warnings and Precautions ( 5.2) ].
Intervention:	The concomitant use of meloxicam with other NSAIDs or salicylates not recommended.
Pemetrexed	
Clinical Impact:	Concomitant use of Meloxicam and pemetrexed may increase the ris of pemetrexed-associated myelosuppression, renal, and GI toxicity (see the pemetrexed prescribing information).
Intervention:	During concomitant use of Medoxicam and permetrexed, in patients with renal impairment whose creatine leckarance ranges from 45 to 79 mil.min. monitor for myelsuppression, renal and GI toxicity. Patients taking meloxicam should interrupt dosing for et less three days before, the day of, and two days following permetrexed in patients with restatine clearance below 45 mil.min, the concomitant administration of meloxicam with permetrexed is not recommended.

### 8 USE IN SPECIFIC POPULATIONS

### 8.1 Pregnancy

Islax ...ummary
Use on NSAIDs, including Mebxicam, can cause premature closure of the fetal ductus
arteriosus and fetal renal dysfunction leading to objohydramnos and, in some cases,
arteriosus and retail renal dysfunction leading to objohydramnos and, in some cases,
the control of the control of the control of the case of the control of Mebxicam
use between about 20 and 30 weeks of gestation, and avoid Mebxicam use at about 30
weeks of gestation and biter in preprincy (see Circlest Considerations, Data).

Premature Closure of Fetal Ductus Arteriosus

remembar Colonie in reservous on les observes de la colonie de la coloni

Data from observational studies regarding potential embryofetal risks of NSAID use in women in the first or second trimesters of pregnancy are inconclusive.

Data from observational studies regarding potential embryofetal risks of NSAID use in women in the first or second trinscribers of pregnancy are inconclusive. In annual reproduction studies, embryofetal death was observed in rats and rabbats in annual reproduction studies, embryofetal death was observed in rats and rabbats. In annual reproduction studies, the result of the studies of the reproduction studies, there was an encased incidence of septial heart defects were observed in rabbbt treated throughout microsace incidence of septial heart defects were observed in rabbst treated throughout how the reproduction studies, there was an increased incidence of dystocia, who terradopen effects were observed in rats and rabbst treated with mebicam during organogenesis at an oral doss equivalent to 2.6 and 2.6-times the MRHID (see Data). In published animal studies, prostagalantial so that complex to the second control of the properties of the of the publication of the properties of the properti

Fetal/Weonatal Adverse Reactions
Premature Closure of Fetal Ductus Arteriosus:

Avoid use of NSAIDs in women at about 30 weeks gestation and later in pregnancy, because NSAIDs, including meloxicam, can cause premature closure of the fetal ductus arteriosus (see Data).

Olgohydramnios/Neonatal Renal Impairment:

If an MSAID is necessary at about 20 weeks gestation or later in preparety, limit the use to the lowest effective does and shortest duration possible. If medicarin treatment extends beyond 48 hours, consider monitoring with ultrasound for oliphydramnios, if oliphydramnios, cut, discontinue meloxicam and follow up according to clinical practice (see Data).

There are no studies on the effects of Meloxicam during labor or delivery. In animal studies, NSAIDs, including meloxicam, inhibit prostaglandin synthesis, cause delayed parturition, and increase the incidence of stillbirth.

# Data Human Data

Premature Closure of Fetal Ductus Arteriosus

Published literature reports that the use of NSAIDs at about 30 weeks of gestation and later in pregnancy may cause premature closure of the fetal ductus arteriosus.

Olgohydramnios/Neonatal Renal Impairment:

Olgohydramnios/Neonstal Renal Impairment:

Published studies and postmarketing reports describe maternal NSAID use at about 20 weeks gestation of their in prepancy absociated with field are and plyfunction leading to outcomes are seen, on average, after days to weeks of treatment, athough outcomes are seen, on average, after days to weeks of treatment, athough olgohydramnios has been infrequently reported as soon as 46 hours after NSAID intaction. Animal Data

Mebociam was not teratogenic when administered to pregnant rats during fetal organogenesis at oral doses up to 4 mgkgdaly (2.6 fold greater than the MRHD of 15 mg of Mebociam placed on BSA comparison). Administration of mebociam to pregnant rabbs throughout entirely openesis produced an increased includes to esplan detects of personal rabbs. The production of the produced and pro

# 8.2 Lactation

8.2 Lactations

There are no human data available on whether meloxicam is present in human milk, or on the effects on breastfed infants, or on milk production. The developmental and health on the effects on breastfed infant or on the effects on the second of the effects of the production. The developmental and health Meloxicam day proteintal advances effects on the breastfed infant from the Meloxicam or not manufact production.

# Data

Adminal Data
Meloxicam was present in the milk of lactating rats at concentrations higher than those in plasma.

# Infertility

Females

Females Based on the mechanism of action, the use of prostaglandin-mediated NSAIDs, including Medoxican, may delay or prevent rupture of ovarian folicies, which has been associated administration of prostaglandin synthesis inhibitors has the protected lod disrupt prostaglandin-mediated folicitude rupture required for ovulation. Small studies in women treated with NSAIDs have also shown a reversible delay in ovulation. Consider withdrawal of NSAIDs, including Medoxican, in women who have difficulties conceiving or who are undergoing investigation of infertility.

The safety and effectiveness of meloxicam in pediatric JRA patients from 2 to 17 years of age has been evaluated in three clinical trials [ see Dosage and Administration ( 2.3), Adverse Reactions ( 6.1) and Clinical Studies ( 14.2) ].

# 8.5 Geriatric Use

Elderly patients, compared to younger patients, are at greater risk for NSAID-associated serious cardiovascular, gastrointestinal, and/or renal adverse reactions. If the anticipated benefit for the elderly plasten outweight shee potential risks, start dosing at the low end of the dosing range, and monktor publishes for adverse effects [ see Warnings and Precautions (5.1, 5.2, 5.3, 5.6.5.1241).

Patients with severe hepatic impairment have not been adequately studied. Since mebxicam is significantly metabolized in the liver and hepatotoxicity may occur, use mebxicam with caution in patients with hepatic impairment [ see Warnings and Precautions (5.3) and clinical Pharmacobgy (12.3)].

### 8.7 Renal Impairment

No dose adjustment is necessary in patients with mild to moderate renal impairment. In Patients with severe renal impairment have not been studied. The use of Metoxican subjects with severe renal impairment is not recommended. In patients on hemodialysis, metoxican should not exceed 7.5 mg per day. Meboxican is not dialyzable [ see Dosage and Administration [ 2.1] and Chinkia Pharmacology [ 2.23] [...]

Symptoms following acute NSAID overdosages have been typically limited to lethargy, drowsiness, nausea, vomiting, and epigastric pain, which have been generally reversible with supportive care. Gastrointestinal bleeding has occurred. Hypertension, acute renal failure, respiratory depression, and coma have occurred, but were rare [ see Warnings and Precautions (5.1, 2.5, 2.4, 5.4).

Manage patients with symptomatic and supportive care following an NSAID overdosage There are no specific artistotes. Consider emissis and/or activated charcoal (60 to 100 grams in adults, 1 to 2 grams per kg of body weight in pediatric patients) and/or somotic cathertic in symptomatic patients seen within four hours of inspection or in patients with all agree overdosage (50 to 10 times the recommended dosage). Forced duces a labellustion of urine, hemodallysis, or hemoperfusion may not be useful due! high protein harding.

There is limited experience with meloxicam overdosage. Cholestyramine is known to accelerate the clearance of meloxicam. Accelerated removal of meloxicam by 4 g oral doses of cholestyramine given three times a day was demonstrated in a clinical trial. Administration of cholestyramine may be useful following an overdosage.

Medixicam Tablests USP are a nonsteroidal anti-inflammatory drug (NSAID). Each table decignated as 4-fixed processor of the second anti-inflammatory drug (NSAID). Each table decignated as 4-fixed processor of the second processor of the second

Mebxicam is a pastel yellow solid, practically insoluble in water, with higher solubility observed in strong acids and bases. It is very slightly soluble in methanol. Meloxicam has an apparent partition coefficient (log P)app = 0.1 in n-octanol/buffer pH 7.4. Meloxicam has pKa values of 1.1 and 4.2.

Meloxicam is available as a tablet for oral administration containing 7.5 mg or 15 mg meloxicam.

The inactive ingredients in Meloxicam tablets USP include colloidal silicon dioxide, crospovidone, lactose monohydrate, magnesium stearate, microcrystalline cellulose, povidone and sodium citrate dihydrate.

### 12.1 Mechanism of Action

14.1 mechanism or action
Meloxicam has analgesic, anti-inflammatory, and antipyretic properties.

The mechanism of action of Meloxicam, like that of other NSAIDs, is not completely understood but involves inhibition of cyclooxygenase (COX-1 and COX-2).

Medicacian is a potent rishbar of or orticalpaints synthesis in vibro Ned-According to the According to the

### 12.3 Pharmacokinetics

### Absorption

Absorption.

The absolute bioavailability of meloxicam capsules was 89% following a single oral dose of 30 mg compared with 30 mg by bolus injection, rollowing single intravenous disease of 30 mg compared with 30 mg by bolus injection. Following single intravenous disease must be compared to the pharmacocinchics of meloxicam capques were dose proportion, over the range of 7.5 mg to 25 mg, belan Cmase was achieved within four to the housz proportiong during absorption. With multiple dosing, steady-state concentrations were reached by Day 5. A second meloxicam concentration peak occurs around 12 to 14 hours pro-ticed sexing selections.
