

IOPAMIDOL- iopamidol injection, solution

Slate Run Pharmaceuticals, LLC

HIGHLIGHTS OF PRESCRIBING INFORMATION

These highlights do not include all the information needed to use IOPAMIDOL INJECTION, USP safely and effectively. See full prescribing information for IOPAMIDOL INJECTION, USP. IOPAMIDOL INJECTION, USP, for intra-arterial or intravenous use
Initial U.S. Approval: 1985

WARNING: RISKS ASSOCIATED WITH INTRATHECAL ADMINISTRATION
See full prescribing information for complete boxed warning.

INDICATIONS AND USAGE

Iopamidol Injection, USP is a radiographic contrast agent indicated for:

Intra-arterial Procedures* (1.1)

- Cerebral arteriography in adults
- Peripheral arteriography in adults
- Selective visceral arteriography and aortography in adults
- Coronary arteriography and cardiac ventriculography in adults
- Angiocardiology in pediatric patients

Intravenous Procedures* (1.2)

- Excretory urography in adults and pediatric patients
- Computed tomography (CT) of head and body in adults and pediatric patients
- Peripheral venography in adults

*Specific concentrations are recommended for each type of imaging procedure. (2.2, 2.3, 2.4)

DOSAGE AND ADMINISTRATION

- Individualize the volume and concentration according to the specific dosing tables accounting for factors such as age, body weight, size of the vessel, and the rate of blood flow within the vessel. (2.2, 2.3, 2.4)
- See full prescribing information for important dosage and administration information. (2.1)

DOSAGE FORMS AND STRENGTHS

Injection: 200 mg Iodine/mL, 250 mg Iodine/mL, 300 mg Iodine/mL, and 370 mg Iodine/mL in single-dose vials (3)

CONTRAINDICATIONS

None (4)

WARNINGS AND PRECAUTIONS

- Hypersensitivity Reactions: Life-threatening or fatal reactions can occur. Always have emergency resuscitation equipment and trained personnel available. (5.2)
- Acute Kidney Injury: Acute injury including renal failure can occur. Use the lowest dose and maintain adequate hydration to minimize risk. (5.3)
- Cardiovascular Adverse Reactions: Hemodynamic disturbances including shock and cardiac arrest may occur during or after iopamidol injection administration. (5.4)
- Thyroid Dysfunction in Pediatric Patients 0 Years to 3 Years of Age: Individualize thyroid function monitoring based on risk factors such as prematurity. (5.8)

ADVERSE REACTIONS

Most common adverse reactions (incidence >1%) are pain, hot flashes, burning sensation, nausea, and warmth. (6.1)

To report SUSPECTED ADVERSE REACTIONS, contact Slate Run Pharmaceuticals, Inc. at 1-888-341-9214 or FDA at 1-800-FDA-1088 or www.fda.gov/medwatch.

USE IN SPECIFIC POPULATIONS

Lactation: A lactating woman may pump and discard breast milk for 10 hours after iopamidol injection administration. (8.2)

See 17 for PATIENT COUNSELING INFORMATION.

17 PATIENT COUNSELING INFORMATION

* Sections or subsections omitted from the full prescribing information are not listed.

FULL PRESCRIBING INFORMATION

WARNING: RISKS ASSOCIATED WITH INTRATHECAL ADMINISTRATION

Intrathecal administration, even if inadvertent, can cause death, convulsions, cerebral hemorrhage, coma, paralysis, arachnoiditis, acute renal failure, cardiac arrest, seizures, rhabdomyolysis, hyperthermia, and brain edema [see Warnings and Precautions (5.1)] . Iopamidol Injection, USP is for intra-arterial or intravenous use only [see Dosage and Administration (2.1)] .

1 INDICATIONS AND USAGE

1.1 Intra-arterial Procedures*

- Cerebral arteriography in adults
- Peripheral arteriography in adults
- Selective visceral arteriography and aortography in adults
- Coronary arteriography and cardiac ventriculography in adults
- Angiocardiology in pediatric patients

1.2 Intravenous Procedures*

- Excretory urography in adults and pediatric patients
- Computed tomography (CT) of head and body in adults and pediatric patients
- Peripheral venography in adults

*Specific concentrations of Iopamidol Injection, USP are recommended for each type of imaging procedure [see Dosage and Administration (2.2, 2.3, 2.4)].

2 DOSAGE AND ADMINISTRATION

2.1 Important Dosing and Administration Information

- Iopamidol Injection, USP is for intra-arterial or intravenous use only and must not be administered intrathecally [see Warnings and Precautions (5.1)] .
- Specific concentrations of Iopamidol Injection, USP are recommended for each type of imaging procedure [see Dosage and Administration (2.2, 2.3, 2.4)] .
- Individualize the volume, concentration, and injection rate of iopamidol injection according to the specific dosing tables [see Dosage and Administration (2.2, 2.3, 2.4)] . Consider factors such as: age, body weight, blood vessel size and blood flow rate, anticipated pathology and degree and extent of opacification required,

structures or area to be examined, concomitant medical conditions, imaging equipment, and technique to be employed.

- Hydrate patients before and after Iopamidol Injection, USP administration [see *Warnings and Precautions (5.3)*].
- Use aseptic technique for all handling and administration of Iopamidol Injection, USP.
- Iopamidol Injection, USP may be administered at either body temperature (37°C, 98.6°F) or room temperature (20°C to 25°C, 68°F to 77°F).
- Visually inspect Iopamidol Injection, USP for particulate matter or discoloration before administration. Do not administer Iopamidol Injection, USP if particulate matter or discolorations are observed.
- Do not mix Iopamidol Injection, USP with other drugs or inject in intravenous lines containing other drugs or total nutritional admixtures.
- Iopamidol Injection, USP single-dose containers are intended for one procedure only. Discard any unused portion.

2.2 Recommended Dosage for Intra-arterial Procedures in Adults

The recommended doses for intra-arterial procedures in adults are shown in Table 1.

Table 1: Recommended Concentrations and Volumes of Iopamidol Injection, USP for Intra-arterial Procedures in Adults

Imaging Procedure	Concentration (mg Iodine/mL)	Volume to Administer per Single Injection for Selected Injection Sites	Maximum Cumulative Total Dose
Cerebral Arteriography	300	8 mL to 12 mL by carotid puncture or transfemoral catheterization	90 mL
Peripheral Arteriography	300	<ul style="list-style-type: none"> • 5 mL to 40 mL into the femoral artery or subclavian artery • 25 mL to 50 mL into the aorta for a distal runoff 	250 mL
Selective Visceral Arteriography and Aortography	370	<ul style="list-style-type: none"> • Up to 10 mL for the renal arteries • Up to 50 mL into the larger vessels such as the aorta or celiac artery 	225 mL
Coronary Arteriography and Cardiac Ventriculography	370	<ul style="list-style-type: none"> • 2 mL to 10 mL for selective coronary artery injection • 25 mL to 50 mL for cardiac ventriculography or for nonselective opacification of multiple coronary arteries following injection at the aortic root 	200 mL

2.3 Recommended Dosage for Intravenous Procedures in Adults

The recommended doses for intra-arterial procedures in adults are shown in Table 2.

Table 2: Recommended Concentrations and Volumes of Iopamidol Injection, USP for Intravenous Procedures in Adults

Imaging Procedure	Concentration (mg Iodine/mL)	Volume to Administer
Excretory Urography	250	50 mL to 100 mL by rapid injection
	300	50 mL by rapid injection
	370	40 mL by rapid injection
CT of the Head	250	130 mL to 240 mL
	300	100 mL to 200 mL
CT of Body	250	130 mL to 240 mL by rapid infusion or bolus injection
	300	100 mL to 200 mL by rapid infusion or bolus injection
	370	80 mL to 160 mL by rapid infusion or bolus injection
Peripheral Venography	200	25 mL to 150 mL per lower extremity; the maximum total dose is 350 mL

2.4 Recommended Dosage in Pediatric Patients

The recommended doses in pediatric patients are shown in Table 3.

Table 3: Recommended Concentrations and Volumes per Body Weight of Iopamidol Injection, USP for Intra-arterial and Intravenous Procedures in Pediatric Patients

Imaging Procedure	Concentration (mg Iodine/mL)	Volume per Body Weight to Administer	Maximum Dose
<i>Intra-arterial Procedures</i>			
Angiocardiography	370	0.5 mL/kg to 2 mL/kg per single injection	<u>Maximum Cumulative Dose by Weight</u> <ul style="list-style-type: none"> • Neonates: 5 mL/kg • Aged 4 weeks and older: 8 mL/kg • Do not exceed maximum cumulative doses by age below. <u>Maximum Cumulative Dose by Age</u> <ul style="list-style-type: none"> • <2 years 40 mL • 2 years to 4 years 50 mL • 5 years to 9 years 100 mL • 10 years to 18 years 125 mL
<i>Intravenous Procedures</i>			
Excretory Urography	250	1.2 mL/kg to 3.6 mL/kg	120 mL
	300	1 mL/kg to 3 mL/kg	100 mL
CT of the Head and Body	250	1.2 mL/kg to 3.6 mL/kg	120 mL
	300	1 mL/kg to	100 mL

		3 mL/kg	
--	--	---------	--

3 DOSAGE FORMS AND STRENGTHS

Injection: Clear, colorless to pale yellow solution available in the following concentrations of iodine:

Concentration (mg Iodine/mL)	Package Size	Package Type
200	50 mL	Single-Dose Vial
250	50 mL	Single-Dose Vial
300	30 mL, 50 mL, 100 mL	Single-Dose Vial
370	50 mL, 75 mL, and 100 mL	Single-Dose Vial

4 CONTRAINDICATIONS

None.

5 WARNINGS AND PRECAUTIONS

5.1 Risks Associated with Intrathecal Administration

Intrathecal administration, even if inadvertent, can cause death, convulsions, cerebral hemorrhage, coma, paralysis, arachnoiditis, acute renal failure, cardiac arrest, seizures, rhabdomyolysis, hyperthermia, and brain edema. Iopamidol injection is for intra-arterial or intravenous use only and must not be administered intrathecally [see *Dosage and Administration* (2.1)].

5.2 Hypersensitivity Reactions

Iopamidol injection can cause life-threatening or fatal hypersensitivity reactions including anaphylaxis. Manifestations include respiratory arrest, laryngospasm, bronchospasm, angioedema, and shock [see *Adverse Reactions* (6.2)] . Most severe reactions develop shortly after the start of injection (e.g., within 1 to 3 minutes), but delayed reactions can also occur. There is increased risk of hypersensitivity reactions in patients with a history of previous reactions to contrast agents, and allergic disorders (i.e., bronchial asthma, allergic rhinitis, and food allergies) or other hypersensitivities.

Premedication with antihistamines or corticosteroids to avoid or minimize possible allergic reactions does not prevent serious life-threatening reactions but may reduce both their incidence and severity. Obtain a history of allergy, hypersensitivity, or hypersensitivity reactions to iodinated contrast agents and always have emergency resuscitation equipment and trained personnel available prior to iopamidol injection administration. Monitor all patients for hypersensitivity reactions.

5.3 Acute Kidney Injury

Acute kidney injury, including renal failure, may occur after iopamidol injection administration. Risk factors include: pre-existing renal insufficiency, dehydration,

diabetes mellitus, congestive heart failure, advanced vascular disease, elderly age, concomitant use of nephrotoxic or diuretic medications, multiple myeloma or other paraproteinemias, and repetitive or large doses of iopamidol injection.

Use the lowest necessary dose of iopamidol injection in patients with renal impairment. Adequately hydrate patients prior to and following iopamidol injection administration. Do not use laxatives, diuretics, or preparatory dehydration prior to iopamidol injection administration.

5.4 Cardiovascular Adverse Reactions

Iopamidol injection increases the circulatory osmotic load and may induce acute or delayed hemodynamic disturbances in patients with congestive heart failure, severely impaired renal function, combined renal and hepatic disease, and combined renal and cardiac disease, particularly when repetitive or large doses are administered. Fatal cardiovascular reactions have occurred mostly within 10 minutes of iopamidol injection; the main feature was cardiac arrest with cardiovascular disease as the main underlying factor. Hypotensive collapse and shock have occurred. Cardiac decompensation, serious arrhythmias, and myocardial ischemia or infarction can occur during coronary arteriography and ventriculography.

The administration of iopamidol injection may cause pulmonary edema in patients with heart failure. Based upon published reports, deaths associated with the administration of iodinated contrast agents range from 6.6 per 1 million (0.00066 percent) to 1 in 10,000 patients (0.01 percent). Use the lowest necessary dose of iopamidol injection in patients with congestive heart failure and always have emergency resuscitation equipment and trained personnel available. Monitor all patients for severe cardiovascular reactions.

5.5 Thromboembolic Events

Serious, in some cases fatal, thromboembolic events, including myocardial infarction and stroke, can occur during angiographic procedures. During these procedures, increased thrombosis and activation of the complement system occurs. Risk factors for developing thromboembolic events include: length of procedure, catheter and syringe material, underlying disease state, and concomitant medications.

To minimize thromboembolic events, use meticulous angiographic techniques and minimize the length of the procedure. Avoid blood remaining in contact with syringes containing iodinated contrast agents, which increases risk of clotting. Avoid angiocardiology in patients with homocystinuria because of the risk of inducing thrombosis and embolism.

5.6 Extravasation and Injection Site Reactions

Extravasation can occur with iopamidol injection administration, particularly in patients with severe arterial or venous disease. Inflammation, blistering, skin necrosis, and compartment syndrome have been reported following extravasation. In addition, injection site reactions such as pain and swelling at the injection site can also occur [see *Adverse Reactions (6.2)*]. Ensure intravascular placement of catheters prior to injection. Monitor patients for extravasation and advise patients to seek medical care for progression of symptoms.

5.7 Thyroid Storm in Patients with Hyperthyroidism

Thyroid storm has occurred after the intravascular use of iodinated agents in patients with hyperthyroidism or with an autonomously functioning thyroid nodule. Evaluate the risk in such patients before use of iopamidol injection

5.8 Thyroid Dysfunction in Pediatric Patients 0 Years to 3 Years of Age

Thyroid dysfunction characterized by hypothyroidism or transient thyroid suppression has been reported after both single exposure and multiple exposures to iodinated contrast agents in pediatric patients 0 years to 3 years of age.

Younger age, very low birth weight, prematurity, underlying medical conditions affecting thyroid function, admission to neonatal or pediatric intensive care units, and congenital cardiac conditions are associated with an increased risk of hypothyroidism after iodinated contrast agent exposure. Pediatric patients with congenital cardiac conditions may be at greatest risk given that they often require high doses of contrast during invasive cardiac procedures.

An underactive thyroid during early life may be harmful for cognitive and neurological development and may require thyroid hormone replacement therapy. After exposure to iodinated contrast agents, individualize thyroid function monitoring based on underlying risk factors, especially in term and preterm neonates.

5.9 Hypertensive Crisis in Patients with Pheochromocytoma

Hypertensive crisis in patients with pheochromocytoma has occurred with iodinated contrast agents. Closely monitor patients when administering iopamidol injection if pheochromocytoma or catecholamine-secreting paragangliomas are suspected. Inject the minimum amount of iopamidol injection necessary and have measures for treatment of hypertensive crisis readily available.

5.10 Sickle Cell Crisis in Patients with Sickle Cell Disease

Iodinated contrast agents can promote sickling in individuals who are homozygous for sickle cell disease. Hydrate patients prior to and following iopamidol injection administration and use only if the necessary imaging information cannot be obtained with alternative imaging modalities.

5.11 Severe Cutaneous Adverse Reactions

Severe cutaneous adverse reactions (SCAR) may develop from 1 hour to several weeks after intravascular contrast agent administration. These reactions include Stevens-Johnson syndrome and toxic epidermal necrolysis (SJS/TEN), acute generalized exanthematous pustulosis (AGEP), and drug reaction with eosinophilia and systemic symptoms (DRESS). Reaction severity may increase and time to onset may decrease with repeat administration of a contrast agent; prophylactic medications may not prevent or mitigate severe cutaneous adverse reactions. Avoid administering iopamidol injection to patients with a history of a severe cutaneous adverse reaction to iopamidol injection.

5.12 Interference with Laboratory Tests

Iopamidol injection can interfere with protein-bound iodine test [*see Drug Interactions* (

7.2)] .

6 ADVERSE REACTIONS

The following adverse reactions are described in greater detail in other sections:

- Risks Associated with Intrathecal Administration [see Warnings and Precautions (5.1)]
- Hypersensitivity Reactions [see Warnings and Precautions (5.2)]
- Acute Kidney Injury [see Warnings and Precautions (5.3)]
- Cardiovascular Adverse Reactions [see Warnings and Precautions (5.4)]
- Thromboembolic Events [see Warnings and Precautions (5.5)]
- Extravasation and Injection Site Reactions [see Warnings and Precautions (5.6)]
- Thyroid Dysfunction in Pediatric Patients 0 to 3 Years of Age [see Warnings and Precautions (5.8)]
- Severe Cutaneous Adverse Reactions [see Warnings and Precautions (5.11)]

6.1 Clinical Trials Experience

Because clinical trials are conducted under widely varying conditions, adverse reaction rates observed in the clinical trials of a drug cannot be directly compared to rates in the clinical trials of another drug and may not reflect the rates observed in practice.

Adverse Reactions in Adults

The safety of iopamidol injection was evaluated in 2,246 adult patients receiving iopamidol injection by intra-arterial or intravenous route in clinical studies. Table 4 shows the common adverse reactions (>1%).

Table 4: Adverse Reactions Reported in >1% of Patients Receiving Intra-arterial or Intravenous Injection of Iopamidol in Clinical Studies

Adverse Reaction	Iopamidol Injection (N=2,246) %
Pain	2.8
Hot flashes	1.5
Burning sensation	1.4
Nausea	1.2
Warmth	1.1

The following adverse reactions occurred in $\leq 1\%$ of patients receiving intra-arterial or intravenous injection of iopamidol injection:

Cardiovascular disorders: tachycardia, hypotension, hypertension, myocardial ischemia, circulatory collapse, S-T segment depression, bigeminy, extrasystoles, ventricular fibrillation, angina pectoris, bradycardia, transient ischemic attack, thrombophlebitis

Gastrointestinal disorders: vomiting, anorexia

General disorders: headache, fever, chills, excessive sweating, back spasm

Nervous system disorders: vasovagal reaction, tingling in arms, grimace, faintness

Renal and urinary disorders: urinary retention

Respiratory: throat constriction, dyspnea, pulmonary edema

Skin and subcutaneous tissues: rash, urticaria, pruritus, flushing

Special senses: taste alterations, nasal congestion, visual disturbances

Adverse Reactions in Pediatric Patients

In a clinical trial with 76 pediatric patients undergoing angiocardigraphy, two adverse reactions (2.6%) were reported: worsening cyanosis and worsening peripheral perfusion.

6.2 Postmarketing Experience

The following adverse reactions have been identified during post approval use of iopamidol injection. Because the reactions are reported voluntarily from a population of uncertain size, it is not always possible to reliably estimate their frequency or to establish a causal relationship to drug exposure.

Blood and lymphatic system disorders: thrombocytopenia

Cardiovascular disorders: cardiopulmonary arrest, cardiac decompensation, arrhythmias, myocardial infarction, shock, electrocardiographic changes (e.g., increased QTc, increased R-R, increased T-wave amplitude), decreased systolic pressure, deep vein thrombosis, arterial spasms, vasodilation, chest pain, pallor

Endocrine disorders: hyperthyroidism, hypothyroidism

Eye disorders: lacrimation increased, conjunctivitis, eye pruritus, transient blindness, visual disturbance, photophobia

Gastrointestinal disorders: retching, abdominal pain, salivary hypersecretion, salivary gland enlargement

General disorders and administration site conditions: injection site pain, malaise

Immune system disorders: anaphylaxis characterized by cardiovascular, respiratory, and cutaneous manifestations (e.g., chest tightness, laryngeal edema, periorbital edema, facial edema); delayed hypersensitivity reactions including generalized maculopapular rash, erythema, pruritus, localized blistering, skin peeling

Musculoskeletal disorders: compartment syndrome following extravasation, muscle spasm, musculoskeletal pain, muscular weakness

Nervous system disorders: coma, seizure, tremors, syncope, depressed level of consciousness or loss of consciousness, encephalopathy

Psychiatric disorders: confusional state

Respiratory system disorders: respiratory arrest, respiratory failure, acute respiratory distress syndrome, respiratory distress, apnea, asthma, sneezing, choking, laryngeal edema, bronchospasm, rhinitis

Skin and subcutaneous tissue disorders: Stevens-Johnson syndrome and toxic epidermal necrolysis (SJS/TEN), acute generalized exanthematous pustulosis (AGEP), erythema multiforme and drug reaction with eosinophilia and systemic symptoms (DRESS), skin

necrosis, face edema

7 DRUG INTERACTIONS

7.1 Drug-Drug Interactions

Metformin

In patients with renal impairment, metformin can cause lactic acidosis. Iodinated contrast agents appear to increase the risk of metformin-induced lactic acidosis, possibly as a result of worsening renal function.

Stop metformin at the time of, or prior to, iopamidol injection administration in patients with an eGFR between 30 and 60 mL/min/1.73 m²; in patients with a history of hepatic impairment, alcoholism, or heart failure; or in patients who will be administered intra-arterial iodinated contrast agents. Re-evaluate eGFR 48 hours after the imaging procedure and reinstitute metformin use only after renal function is stable.

Radioactive Iodine

Administration of iopamidol injection may interfere with thyroid uptake of radioactive iodine (I-131 and I-123) and decrease therapeutic and diagnostic efficacy. Avoid thyroid therapy or testing for up to 6 weeks post iopamidol injection

7.2 Drug-Laboratory Test Interactions

Protein-Bound Iodine Test

Iodinated contrast agents, including iopamidol injection, will temporarily increase protein-bound iodine in blood. Avoid protein-bound iodine test for at least 16 days following administration of iopamidol injection. However, thyroid function tests that do not depend on iodine estimations, e.g., triiodothyronine (T₃) resin uptake and total or free thyroxine (T₄) assays, are not affected.

8 USE IN SPECIFIC POPULATIONS

8.1 Pregnancy

Risk Summary

Available data from published literature and postmarketing cases from decades of use with iopamidol during pregnancy have not identified a drug-associated risk of major birth defects, miscarriage, or other adverse maternal or fetal outcomes. Iopamidol crosses the placenta and reaches fetal tissues in small amounts (see Data). In animal reproduction studies, no adverse developmental outcomes were observed with intravenous administration of iopamidol to pregnant rats and rabbits during organogenesis at doses up to 2.7 and 1.4 times, respectively, the maximum recommended human dose (see Data).

The background risk of major birth defects and miscarriage for the indicated population is unknown. All pregnancies have a background risk of birth defect, loss, or other adverse outcomes. In the U.S. general population, the estimated background risk of major birth defects and miscarriage in clinically recognized pregnancies is 2 to 4% and

15 to 20%, respectively.

Data

Human Data

Literature reports show that intravenously administered iopamidol crosses the placenta and is visualized in the digestive tract of exposed infants after birth.

Animal Data

Iopamidol did not affect fetal development and did not induce teratogenic changes in the offspring in either rats or rabbits at the following dose levels tested: 600 mg, 1,500 mg, or 4,000 mg iodine/kg in rats, administered intravenously once a day during days 6 through 15 of pregnancy; 300 mg, 800 mg, or 2,000 mg iodine/kg in rabbits, administered intravenously once a day during days 6 through 18 of pregnancy.

8.2 Lactation

Risk Summary

There are no data on the presence of iopamidol in human milk, the effects on the breastfed infant, or the effects on milk production. Iodinated contrast agents are present unchanged in human milk in very low amounts, with poor absorption from the gastrointestinal tract of a breastfed infant. The developmental and health benefits of breastfeeding should be considered along with the mother's clinical need for iopamidol injection and any potential adverse effects on the breastfed infant from iopamidol injection or from the underlying maternal condition.

Clinical Considerations

Interruption of breastfeeding after exposure to iodinated contrast agents is not necessary because the potential exposure of the breastfed infant to iodine is small. However, a lactating woman may consider interrupting breastfeeding and pumping and discarding breast milk for 10 hours (approximately 5 half-lives) after iopamidol injection administration in order to minimize drug exposure to a breastfed infant.

8.4 Pediatric Use

The safety and effectiveness of iopamidol injection have been established in pediatric patients for angiocardiology, excretory urography, and contrast computed tomography (head and body).

Pediatric patients at higher risk of experiencing adverse reactions during and after contrast medium administration may include those having asthma, sensitivity to medication or allergens, cyanotic heart disease, congestive heart failure, or serum creatinine greater than 1.5 mg/dL, or those less than 12 months of age.

Thyroid function tests indicative of thyroid dysfunction, characterized by hypothyroidism or transient thyroid suppression have been reported following iodinated contrast media administration in pediatric patients, including term and preterm neonates; some patients were treated for hypothyroidism. After exposure to iodinated contrast media, individualize thyroid function monitoring in pediatric patients 0 years to 3 years of age based on underlying risk factors, especially in term and preterm neonates [*see Warning and Precautions (5.8) and Adverse Reactions (6.2)*] .

The safety and effectiveness of iopamidol injection for cerebral, peripheral, and selective visceral arteriography, aortography, coronary arteriography, cardiac ventriculography, and peripheral venography have not been established in pediatric patients.

8.5 Geriatric Use

Iopamidol is excreted by the kidney, and the risk of adverse reactions to iopamidol injection may be greater in patients with renal impairment. Because patients 65 years of age and older are more likely to have renal impairment, care should be taken in dose selection, and it may be useful to monitor renal function [see *Warnings and Precautions* (5.3) and *Use in Specific Populations* (8.6)] .

8.6 Renal Impairment

The clearance of iopamidol decreases with increasing degree of renal impairment and results in delayed opacification of the urinary system. In addition, preexisting renal impairment increases the risk for acute kidney injury [see *Warnings and Precautions* (5.3)]. Iopamidol can be removed by dialysis.

10 OVERDOSAGE

The manifestations of overdose are life-threatening and affect mainly the pulmonary and cardiovascular systems. Treatment of an overdose is directed toward support of all vital functions and the prompt institution of symptomatic therapy. Iopamidol can be removed by dialysis.

11 DESCRIPTION

Iopamidol Injection, USP is a radiographic contrast agent for intra-arterial or intravenous use.

Iopamidol is designated chemically as (S)-N,N'-bis[2-hydroxy-1-(hydroxymethyl)-ethyl]-2,4,6-triiodo-5-lactamidoisophthalamide with a molecular weight of 777.09, an empirical formula of $C_{17}H_{22}I_3N_3O_8$, and the following structural formula:

Iopamidol Injection, USP is a sterile, clear, colorless to pale yellow solution available in four concentrations of iodine:

- Iopamidol Injection, USP, 200 mg iodine/mL: Each mL contains 408 mg iopamidol (providing 200 mg organically bound iodine) and the following inactive ingredients: 0.26 mg edetate calcium disodium (providing 0.029 mg (0.001 mEq) sodium) and 1 mg tromethamine.
- Iopamidol Injection, USP, 250 mg iodine/mL: Each mL contains 510 mg iopamidol (providing 250 mg organically bound iodine) and the following inactive ingredients: 0.33 mg edetate calcium disodium (providing 0.036 mg (0.002 mEq) sodium) and 1 mg tromethamine.
- Iopamidol Injection, USP, 300 mg iodine/mL: Each mL contains 612 mg iopamidol (providing 300 mg organically bound iodine) and the following inactive ingredients: 0.39 mg edetate calcium disodium (providing 0.043 mg (0.002 mEq) sodium) and 1 mg tromethamine.
- Iopamidol Injection, USP, 370 mg iodine/mL: Each mL contains 755 mg iopamidol (providing 370 mg organically bound iodine) and the following inactive ingredients: 0.48 mg edetate calcium disodium (providing 0.053 mg (0.002 mEq) sodium) and 1 mg tromethamine.

The pH of Iopamidol Injection, USP has been adjusted to 6.5 to 7.5 with hydrochloric acid and/or sodium hydroxide.

Physicochemical characteristics are shown in Table 5. Iopamidol Injection, USP is hypertonic as compared to plasma and cerebrospinal fluid (approximately 285 and 301 mOsm/kg water, respectively).

Table 5: Physicochemical Characteristics of Iopamidol Injection, USP

Concentration (mg Iodine/mL)	200	250	300	370
Osmolality @ 37°C (mOsm/kg water)	413	524	616	796
Viscosity (cP) @ 37°C	2.0	3.0	4.7	9.4
Viscosity (cP) @ 20°C	3.3	5.1	8.8	20.9
Specific Gravity @ 37°C	1.227	1.281	1.339	1.405

12 CLINICAL PHARMACOLOGY

12.1 Mechanism of Action

Intravascular injection of iopamidol opacifies those vessels where the contrast agent is present, permitting radiographic visualization through attenuation of photons.

In imaging of the body, iodinated contrast agents diffuse from the vessels into the extravascular space. In normal brain with an intact blood-brain barrier, contrast does not diffuse into the extravascular space. In patients with a disrupted blood-brain barrier, contrast agent accumulates in the extravascular space in the region of disruption.

12.2 Pharmacodynamics

Following administration of iopamidol injection, the degree of enhancement is related to the iodine concentration in the tissue of interest. However, the exposure-response relationships and time course of pharmacodynamic response of iopamidol have not

been fully characterized.

12.3 Pharmacokinetics

Distribution

Plasma concentrations of iodine fall within 5 to 10 minutes due to distribution into the vascular and extracellular fluid compartments. Equilibration with the extracellular compartments is reached in about 10 minutes.

The apparent volume of distribution suggests that iopamidol is distributed evenly between blood and extracellular fluid. Iopamidol may be visualized in the renal parenchyma within 30 to 60 seconds following rapid intravenous administration. Iopamidol did not bind to serum or plasma proteins at 1 hour after administration.

Elimination

The plasma half-life is approximately 2 hours; the half-life is not dose dependent.

Metabolism

Iopamidol does not undergo significant metabolism, deiodination, or biotransformation.

Excretion

Iopamidol is excreted primarily through the kidneys. In patients with normal renal function, the cumulative urinary excretion for iopamidol, expressed as a percentage of administered intravenous dose, is approximately 35% to 40% at 60 minutes, 80% to 90% at 8 hours, and 90% or greater in the 72- to 96-hour period after administration. In patients with normal renal function, approximately 1% or less of the administered dose appears in cumulative 72- to 96-hour fecal samples.

13 NONCLINICAL TOXICOLOGY

13.1 Carcinogenesis, Mutagenesis, Impairment of Fertility

Long-term studies in animals have not been performed with iopamidol to evaluate carcinogenic potential. No evidence of genetic toxicity was obtained in in vitro tests. In animal reproduction studies performed on rats, intravenously administered iopamidol did not induce adverse effects on fertility or general reproductive performance.

16 HOW SUPPLIED/STORAGE AND HANDLING

How Supplied

Iopamidol Injection, USP is a clear, colorless to pale yellow solution available in the following presentations:

Concentration (mg Iodine/mL)	Package Size	Package Type	Sale Unit	NDC
200	50 mL	Single-dose vial	Carton of 1	70436-211-80
250	50 mL	Single-dose vial	Carton of 10	70436-125-82
300	30 mL	Single-dose vial	Carton of 10	70436-219-52

300	50 mL	Single-dose vial	Carton of 10	70436-219-62
300	100 mL	Single-dose vial	Carton of 10	70436-219-82
370	50 mL	Single-dose vial	Carton of 10	70436-127-52
370	75 mL	Single-dose vial	Carton of 10	70436-127-62
370	100 mL	Single-dose vial	Carton of 10	70436-127-82

Storage and Handling

Store at 20° to 25°C (68° to 77°F) [See USP Controlled Room Temperature]. Protect from light.

17 PATIENT COUNSELING INFORMATION

Hypersensitivity Reactions

Advise the patient concerning the risk of hypersensitivity reactions that can occur both during and after iopamidol injection administration. Advise the patient to report any signs or symptoms of hypersensitivity reactions during the procedure and to seek immediate medical attention for any signs or symptoms experienced after discharge [see *Warnings and Precautions (5.2)*].

Advise patients to inform their physician if they develop a rash after receiving Iopamidol Injection, USP [see *Warnings and Precautions (5.11)*].

Acute Kidney Injury

Advise the patient concerning appropriate hydration to decrease the risk of contrast induced kidney injury [see *Warnings and Precautions (5.3)*].

Extravasation

If extravasation occurs during injection, advise patients to seek medical care for progression of symptoms [see *Warnings and Precautions (5.6)*].

Thyroid Dysfunction

Advise parents/caregivers about the risk of developing thyroid dysfunction after iopamidol injection administration. Advise parents/caregivers about when to seek medical care for their child to monitor for thyroid function [see *Warnings and Precautions (5.8)*].

Lactation

Advise a lactating woman that interruption of breastfeeding is not necessary, however, to minimize exposure to a breastfed infant, a lactating woman may consider pumping and discarding breast milk for 10 hours after iopamidol injection administration [see *Use in Specific Populations (8.2)*].
