

METHYLPHENIDATE TRANSDERMAL SYSTEM- methylphenidate patch PADAGIS US LLC

HIGHLIGHTS OF PRESCRIBING INFORMATION

These highlights do not include all the information needed to use METHYLPHENIDATE TRANSDERMAL SYSTEM safely and effectively. See full prescribing information for METHYLPHENIDATE TRANSDERMAL SYSTEM.

Methylphenidate Transdermal System, CII
Initial U.S. Approval: 2006

WARNING: ABUSE, MISUSE, AND ADDICTION

☐ See full prescribing information for complete boxed warning

Methylphenidate Transdermal System has high potential for abuse and misuse, which can lead to the development of a substance use disorder, including addiction. Misuse and abuse of CNS stimulants, including Methylphenidate Transdermal System, can result in overdose and death (5.1, 9.2, 10):

- Before prescribing Methylphenidate Transdermal System, assess each patient's risk for abuse, misuse, and addiction.
- Educate patients and their families about these risks, proper storage of the drug, and proper disposal of any unused drug.
- Throughout treatment, reassess each patient's risk and frequently monitor for signs and symptoms of abuse, misuse, and addiction.

RECENT MAJOR CHANGES

Indications and Usage (1) 09/2025
Warning and Precautions (5.8) 09/2025

INDICATIONS AND USAGE

Methylphenidate Transdermal System is a central nervous system (CNS) stimulant indicated for the treatment of Attention Deficit Hyperactivity Disorder (ADHD) in pediatric patients 6 to 17 years of age. (1)
Limitations of Use

The use of Methylphenidate Transdermal System is not recommended in pediatric patients younger than 6 years of age because they had higher plasma exposure and a higher incidence of adverse reactions (e.g., weight loss) than patients 6 years and older at the same dosage (5.8, 8.4).

DOSAGE AND ADMINISTRATION

- The recommended starting dose for patients new to or converting from another formulation of methylphenidate is 10 mg. (2.2)
- Methylphenidate Transdermal System should be applied to the hip area (using alternating sites) 2 hours before an effect is needed and should be removed 9 hours after application. Methylphenidate Transdermal System may be removed earlier than 9 hours if a shorter duration of effect is desired or late day side effects appear. (2.2, 2.3)
- Dosage should be titrated to effect. Dose titration, final dosage, and wear time should be individualized according to the needs and response of the patient. (2.2)

DOSAGE FORMS AND STRENGTHS

Transdermal system: 10mg/9 hours (1.1 mg/hr), 15mg/9 hours (1.6 mg/hr), 20mg/9 hours (2.2 mg/hr), 30mg/9 hours (3.3 mg/hr) (3)

CONTRAINDICATIONS

- Known hypersensitivity to methylphenidate (4.1)
- Patients currently using or within 2 weeks of using an MAO inhibitor (4.2)

WARNINGS AND PRECAUTIONS

- Risks to Patients with Serious Cardiac Disease: Avoid use in patients with known structural cardiac abnormalities, cardiomyopathy, serious cardiac arrhythmias, coronary artery disease, or other serious cardiac disease. (5.2)
- Increased Blood Pressure and Heart Rate: Monitor blood pressure and pulse. (5.3)
- Psychiatric Adverse Reactions: Prior to initiating Methylphenidate Transdermal System, screen patients for risk factors for developing a manic episode. If new psychotic or manic symptoms occur, consider discontinuing Methylphenidate Transdermal System. (5.4)
- Seizures: Stimulants may lower the convulsive threshold. Discontinue in the presence of seizures. (5.5)
- Priapism: If abnormally sustained or frequent and painful erections occur, patients should seek

immediate medical attention. (5.6)

- Peripheral Vasculopathy, including Raynaud’s phenomenon: Careful observation for digital changes is necessary during Methylphenidate Transdermal System treatment. Further clinical evaluation (e.g., rheumatology referral) may be appropriate for patients who develop signs or symptoms of peripheral vasculopathy. (5.7)
- Long-Term Suppression of Growth in Pediatric Patients: Closely monitor (height and weight) in pediatric patients. Pediatric patients not growing or gaining height or weight as expected may need to have their treatment interrupted. (5.8)
- Chemical Leukoderma: Methylphenidate Transdermal System use may result in a persistent loss of skin pigmentation at and around the application site. Loss of pigmentation, in some cases, has been reported at other sites distant from the application site. Monitor for signs of skin depigmentation. Discontinue Methylphenidate Transdermal System if it occurs. (5.9)
- Contact Sensitization: Use of Methylphenidate Transdermal System may lead to contact sensitization. Treatment should be discontinued if contact sensitization is suspected. Erythema is commonly seen with use of Methylphenidate Transdermal System and is not by itself an indication of sensitization. However, contact sensitization should be suspected if erythema is accompanied by evidence of a more intense local reaction (edema, papules, vesicles) that does not significantly improve within 48 hours or spreads beyond the transdermal system site. (5.10)
- External Heat: Patients should be advised to avoid exposing the Methylphenidate Transdermal System application site to direct external heat sources. When heat is applied to Methylphenidate Transdermal System after application, both the rate and extent of absorption are significantly increased. (5.11)
- Hematologic monitoring: Periodic CBC, differential, and platelet counts are advised during prolonged therapy. (5.12)
- Acute Angle Closure Glaucoma: Methylphenidate Transdermal System -treated patients considered at risk for acute angle closure glaucoma (e.g., patients with significant hyperopia) should be evaluated by an ophthalmologist. (5.13)
- Increased Intraocular Pressure (IOP) and Glaucoma: Prescribe Methylphenidate Transdermal System to patients with open-angle glaucoma or abnormally increased IOP only if the benefit of treatment is considered to outweigh the risk. Closely monitor patients with a history of increased IOP or open angle glaucoma. (5.14)
- Motor and Verbal Tics and Worsening of Tourette’s Syndrome: Before initiating Methylphenidate Transdermal System, assess the family history and clinically evaluate patients for tics or Tourette’s syndrome. Regularly monitor patients for the emergence or worsening of tics or Tourette’s syndrome. Discontinue treatment if clinically appropriate. (5.15)

-----**ADVERSE REACTIONS**-----

- Pediatric patients (ages 6 to 12 years): The most commonly ($\geq 5\%$ and twice the rate of placebo) reported adverse reactions in pediatric patients ages 6 to 12 years included appetite decreased, insomnia, nausea, vomiting, weight decreased, tic, affect lability, and anorexia. (6.1)
- Pediatric patients (ages 13 to 17 years): The most commonly ($\geq 5\%$ and twice the rate of placebo) reported adverse reactions in pediatric patients ages 13 to 17 years included appetite decreased, nausea, insomnia, weight decreased, dizziness, abdominal pain, and anorexia. The majority of subjects in these trials had erythema at the application site. (6.1)

To report SUSPECTED ADVERSE REACTIONS, contact Padagis at 1-866-634-9120 or FDA at 1-800-FDA-1088 or www.fda.gov/medwatch.

-----**DRUG INTERACTIONS**-----

- Antihypertensive Drugs: Monitor blood pressure. Adjust dosage of antihypertensive drug as needed. (7.2)

See 17 for PATIENT COUNSELING INFORMATION and Medication Guide.

Revised: 9/2025

17 PATIENT COUNSELING INFORMATION

* Sections or subsections omitted from the full prescribing information are not listed.

WARNING: ABUSE, MISUSE, AND ADDICTION

Methylphenidate Transdermal System has a high potential for abuse and misuse, which can lead to the development of substance use disorder, including addiction. Misuse and abuse of CNS stimulants, including Methylphenidate Transdermal System, can result in overdose and death [see *Overdosage (10)*], and this risk is increased with higher doses or unapproved methods of administration, such as snorting or injection.

Before prescribing Methylphenidate Transdermal System, assess each patient's risk for abuse, misuse, and addiction. Educate patients and their families about these risks, proper storage of the drug, and proper disposal of any unused drug. Throughout Methylphenidate Transdermal System treatment, reassess each patient's risk of abuse, misuse, and addiction and frequently monitor for signs and symptoms of abuse, misuse, and addiction [see *Warnings and Precautions (5.1)* and *Drug Abuse and Dependence (9.2)*].

1 INDICATIONS AND USAGE

Methylphenidate Transdermal System (methylphenidate transdermal system) is indicated for the treatment of Attention Deficit Hyperactivity Disorder (ADHD) in pediatric patients 6 to 17 years of age.

Limitations of Use

The use of Methylphenidate Transdermal System is not recommended in pediatric patients younger than 6 years of age because they had higher plasma exposure and a higher incidence of adverse reactions (e.g., weight loss) than patients 6 years and older at the same dosage [see *Warnings and Precautions (5.8)*, *Use in Specific Populations (8.4)*].

2 DOSAGE AND ADMINISTRATION

2.1 Pretreatment Screening

Prior to treating patients with Methylphenidate Transdermal System, assess:

- for the presence of cardiac disease (i.e., perform a careful history, family history of sudden death or ventricular arrhythmia, and physical exam) [see *Warnings and Precautions (5.2)*].
- the family history and clinically evaluate patients for motor or verbal tics or Tourette's syndrome before initiating Methylphenidate Transdermal System [see *Warnings and Precautions (5.15)*].

2.2 Recommended Dosage

It is recommended that Methylphenidate Transdermal System be applied to the hip area 2 hours before an effect is needed and should be removed 9 hours after application. Dosage should be titrated to effect. The recommended dose titration schedule is shown in the table below. Dose titration, final dosage, and wear time should be individualized according to the needs and response of the patient.

Table 1 Methylphenidate Transdermal System - Recommended Titration Schedule (Patients New to Methylphenidate)

Upward Titration, if Response is Not Maximized

	Week 1	Week 2	Week 3	Week 4
Transdermal System Size	12.5 cm ²	18.75 cm ²	25 cm ²	37.5 cm ²
Nominal Delivered Dose* (mg/9 hours)	10 mg	15 mg	20 mg	30 mg
Delivery Rate*	(1.1 mg/hr)*	(1.6 mg/hr)*	(2.2 mg/hr)*	(3.3 mg/hr)*

*Nominal *in vivo* delivery rate in children and adolescents when applied to the hip, based on a 9-hour wear period.

Patients converting from another formulation of methylphenidate should follow the above titration schedule due to differences in bioavailability of Methylphenidate Transdermal System compared to other products.

2.3 Application

The parent or caregiver should be encouraged to use the administration chart included with each carton of Methylphenidate Transdermal System to monitor application and removal time, and method of disposal. It is recommended that parents or caregivers apply and remove the transdermal system for children; responsible adolescents may apply or remove the transdermal system themselves if appropriate. If a transdermal system was removed without the parent or caregiver's knowledge, or if a transdermal system is missing from the tray, the parent or caregiver should be encouraged to ask the child when and how the transdermal system was removed. The Medication Guide includes a timetable to calculate when to remove Methylphenidate Transdermal System, based on the 9-hour application time.

The adhesive side of Methylphenidate Transdermal System should be placed on a clean, dry area of the hip. The area selected should not be oily, damaged, or irritated. Apply Methylphenidate Transdermal System to the hip area avoiding the waistline, since clothing may cause the transdermal system to rub off. When applying the transdermal system the next morning, place on the opposite hip at a new site if possible.

If patients or caregivers experience difficulty separating the transdermal system from the release liner or observe transfer of adhesive to the liner, tearing and/or other damage to the transdermal system during removal from the liner, the transdermal system should be discarded and a new transdermal system should be applied. Patients or caregivers should inspect the release liner to ensure that no adhesive containing medication has transferred to the liner. If adhesive transfer has occurred, the transdermal system should be discarded. Refer to the *Instructions for Use* for recommendations for discarding used Methylphenidate Transdermal System.

Methylphenidate Transdermal System should be applied immediately after opening the individual pouch and removing the protective liner. Do not use if the individual pouch seal is broken or if the transdermal system appears to be damaged. Do not cut transdermal systems. Only intact transdermal systems should be applied. The transdermal system should then be pressed firmly in place with the palm of the hand for approximately 30 seconds, making sure that there is good contact of the transdermal system with the skin, especially around the edges. Exposure to water during bathing, swimming, or showering can affect transdermal system adherence. Methylphenidate Transdermal System should not be applied or re-applied with dressings, tape, or other common adhesives. In the event that a transdermal system does not fully adhere to the skin upon application, or becomes partially or fully detached during wear time, the transdermal system should be discarded and a new transdermal system may be applied at a different site. The total recommended wear time for that day should remain 9 hours regardless of the number of transdermal systems used.

All patients should be advised to avoid exposing the Methylphenidate Transdermal

System application site to direct external heat sources, such as hair dryers, heating pads, electric blankets, heated water beds, etc., while wearing the transdermal system [see *Warnings and Precautions (5.10)*]. When heat is applied to Methylphenidate Transdermal System after transdermal system application, both the rate and the extent of absorption are significantly increased. The temperature-dependent increase in methylphenidate absorption can be greater than 2-fold [see *Clinical Pharmacology (12.3)*]. This increased absorption can be clinically significant and result in overdose of methylphenidate [see *Overdosage (10)*].

Methylphenidate Transdermal System should not be stored in refrigerators or freezers.

2.4 Removal of Methylphenidate Transdermal System

Methylphenidate Transdermal System should be peeled off slowly. If necessary, transdermal system removal may be facilitated by gently applying an oil-based product (i.e., petroleum jelly, olive oil, or mineral oil) to the transdermal system edges, gently working the oil underneath the transdermal system edges. If any adhesive remains on the skin following transdermal system removal, an oil-based product may be applied to transdermal system sites in an effort to gently loosen and remove any residual adhesive that remains following transdermal system removal.

In the unlikely event that a transdermal system remains tightly adhered despite these measures, the patient or caregiver should contact the physician or pharmacist. Nonmedical adhesive removers and acetone-based products (i.e., nail polish remover) should not be used to remove Methylphenidate Transdermal System or adhesive.

2.5 Dose/Wear Time Reduction and Discontinuation

Methylphenidate Transdermal System may be removed earlier than 9 hours if a shorter duration of effect is desired or late day side effects appear. Plasma concentrations of *d*-methylphenidate generally begin declining when the transdermal system is removed, although absorption may continue for several hours. Individualization of wear time may help manage some of the side effects caused by methylphenidate. If aggravation of symptoms or other adverse events occur, the dosage or wear time should be reduced, or, if necessary, the drug should be discontinued. Residual methylphenidate remains in used transdermal systems when worn as recommended.

3 DOSAGE FORM AND STRENGTHS

Four dosage strengths are available:

Nominal Dose Delivered (mg) Over 9 Hours*	Dosage Rate* (mg/hr)	Transdermal System Size (cm²)	Methylphenidate Content per Transdermal System (mg)
10	1.1	12.5	27.5
15	1.6	18.75	41.3
20	2.2	25	55
30	3.3	37.5	82.5

*Nominal *in vivo* delivery rate in children and adolescents when applied to the hip, based on a 9-hour wear period.

4 CONTRAINDICATIONS

4.1 Hypersensitivity to Methylphenidate

Methylphenidate Transdermal System is contraindicated in patients known to be hypersensitive to methylphenidate or other components of the product (polyester/ethylene vinyl acetate laminate film backing, acrylic adhesive, silicone adhesive, and fluoropolymer-coated polyester) [*see Description (11)*].

4.2 Monoamine Oxidase Inhibitors

Methylphenidate Transdermal System is contraindicated during treatment with monoamine oxidase inhibitors, and within a minimum of 14 days following discontinuation of treatment with a monoamine oxidase inhibitor (hypertensive crises may result).

5 WARNINGS AND PRECAUTIONS

5.1 Abuse, Misuse, and Addiction

Methylphenidate Transdermal System has a high potential for abuse and misuse. The use of Methylphenidate Transdermal System exposes individuals to the risks of abuse and misuse, which can lead to the development of a substance use disorder, including addiction. Methylphenidate Transdermal System can be diverted for non-medical use into illicit channels or distribution [*see Drug Abuse and Dependence (9.2)*]. Misuse and abuse of CNS stimulants, including Methylphenidate Transdermal System, can result in overdose and death [*see Overdosage (10)*], and this risk is increased with higher doses or unapproved methods of administration, such as snorting or injection.

Before prescribing Methylphenidate Transdermal System, assess each patient's risk for abuse, misuse, and addiction. Educate patients and their caregivers or families about these risks. Advise patients to store Methylphenidate Transdermal System in a safe place, preferably locked, and instruct patients to not give Methylphenidate Transdermal System to anyone else. Throughout Methylphenidate Transdermal System treatment, reassess each patient's risk of abuse, misuse, and addiction and frequently monitor for signs and symptoms of abuse, misuse, and addiction.

Methylphenidate Transdermal System has special disposal instructions. Instruct patients to find a take back location to dispose of unused or expired Methylphenidate Transdermal System. If a take back program is unavailable, instruct them to:

1. Remove Methylphenidate Transdermal System from its pouch, separate it from its liner, fold it in half with the adhesive sides touching each other, and immediately flush the used transdermal system down the toilet, and
2. Place the pouch and liner in a container, close the container, and throw out the container in the trash (advise patients not to flush the pouch and liner down the toilet).

5.2 Risks to Patients with Serious Cardiac Disease

Sudden death has been reported in patients with structural cardiac abnormalities or other serious cardiac disease who were treated with CNS stimulants at the recommended ADHD dosage.

Avoid Methylphenidate Transdermal System use in patients with known structural cardiac abnormalities, cardiomyopathy, serious cardiac arrhythmia, coronary artery disease, or other serious cardiac disease.

5.3 Increased Blood Pressure and Heart Rate

CNS stimulants may cause an increase in blood pressure (mean increase approximately 2 to 4 mmHg) and heart rate (mean increase approximately 3 to 6 bpm). Some patients may have larger increases.

Monitor all Methylphenidate Transdermal System -treated patients for hypertension and tachycardia.

5.4 Psychiatric Adverse Reactions

Exacerbation of Pre-Existing Psychosis

CNS stimulants may exacerbate symptoms of behavior disturbance and thought disorder in patients with a pre-existing psychotic disorder.

Induction of a Manic Episode in Patients with Bipolar Disease

CNS stimulants may induce a manic or mixed episode in patients. Prior to initiating Methylphenidate Transdermal System treatment, screen patients for risk factors for developing a manic episode (e.g., comorbid or history of depressive symptoms or a family history of suicide, bipolar disorder, or depression).

New Psychotic or Manic Symptoms

CNS stimulants, at the recommended dosages, may cause psychotic or manic symptoms, (e.g., hallucinations, delusional thinking, or mania) in patients without a prior history of psychotic illness or mania. In a pooled analysis of multiple short-term, placebo-controlled studies of CNS stimulants, psychotic or manic symptoms occurred in approximately 0.1% of CNS stimulant-treated patients compared with 0% of placebo-treated patients. If such symptoms occur, consider discontinuing Methylphenidate Transdermal System.

5.5 Seizures

There is some clinical evidence that stimulants may lower the convulsive threshold in patients with prior history of seizures, in patients with prior EEG abnormalities in absence of seizures, and, very rarely, in patients without a history of seizures and no prior EEG evidence of seizures. In the presence of seizures, the drug should be discontinued.

5.6 Priapism

Prolonged and painful erections, sometimes requiring surgical intervention, have been reported with methylphenidate use in both adult and pediatric male patients. Although priapism was not reported with methylphenidate initiation, it developed after some time on the methylphenidate, often subsequent to an increase in dosage. Priapism also occurred during methylphenidate withdrawal (drug holidays or during discontinuation).

Methylphenidate Transdermal System -treated patients who develop abnormally sustained or frequent and painful erections should seek immediate medical attention.

5.7 Peripheral Vasculopathy, including Raynaud's phenomenon

Stimulant medications, including Methylphenidate Transdermal System, used to treat ADHD are associated with peripheral vasculopathy, including Raynaud's phenomenon. Signs and symptoms are usually intermittent and mild; however, sequelae have included digital ulceration and/or soft tissue breakdown. Effects of peripheral vasculopathy, including Raynaud's phenomenon, were observed in post-marketing reports and at therapeutic dosages of CNS stimulants in all age groups throughout the course of treatment. Signs and symptoms generally improved after dosage reduction or discontinuation of the CNS stimulant.

Careful observation for digital changes is necessary during Methylphenidate Transdermal System treatment. Further clinical evaluation (e.g., rheumatology referral) may be appropriate for Methylphenidate Transdermal System -treated patients who develop signs or symptoms of peripheral vasculopathy.

5.8 Long-Term Suppression of Growth in Pediatric Patients

Methylphenidate Transdermal System is not approved for use and is not recommended in pediatric patients below 6 years of age [see *Use in Specific Populations (8.4)*].

CNS stimulants have been associated with weight loss and slowing of growth rate in pediatric patients.

Careful follow-up of weight and height in children ages 7 to 10 years who were randomized to either methylphenidate or non-medication treatment groups over 14 months, as well as in naturalistic subgroups of newly methylphenidate-treated and non-medication treated children over 36 months (to the ages of 10 to 13 years), suggests that pediatric patients who received methylphenidate for 7 days per week throughout the year had a temporary slowing in growth rate (on average, a total of about 2 cm less growth in height and 2.7 kg less growth in weight over 3 years), without evidence of growth rebound during this development period.

Closely monitor growth (weight and height) in Methylphenidate Transdermal System - treated pediatric patients. Pediatric patients not growing or gaining height or weight as expected may need to have their treatment interrupted.

5.9 Chemical Leukoderma

Methylphenidate Transdermal System use may result in a persistent loss of skin pigmentation at and around the application site. Loss of pigmentation, in some cases, has been reported at other sites distant from the application site. Chemical leukoderma can mimic the appearance of vitiligo, particularly when the loss of skin pigmentation involves areas distant from the application site. Individuals with a history of vitiligo and/or a family history of vitiligo may be more at risk. Skin depigmentation may persist even after Methylphenidate Transdermal System use is discontinued. Monitor for signs of skin depigmentation, and advise patients to immediately inform their healthcare provider if changes in skin pigmentation occur. Discontinue use of the Methylphenidate Transdermal System in patients with chemical leukoderma.

5.10 Contact Sensitization

In an open-label study of 305 subjects conducted to characterize dermal reactions in children with ADHD treated with Methylphenidate Transdermal System using a 9-hour wear time, one subject (0.3%) was confirmed by patch testing to be sensitized to methylphenidate (allergic contact dermatitis). This subject experienced erythema and edema at Methylphenidate Transdermal System application sites with concurrent urticarial lesions on the abdomen and legs resulting in treatment discontinuation. This subject was not transitioned to oral methylphenidate.

Use of Methylphenidate Transdermal System may lead to contact sensitization. Methylphenidate Transdermal System should be discontinued if contact sensitization is suspected. Erythema is commonly seen with use of Methylphenidate Transdermal System and is not by itself an indication of sensitization. However, contact sensitization should be suspected if erythema is accompanied by evidence of a more intense local reaction (edema, papules, vesicles) that does not significantly improve within 48 hours or spreads beyond the transdermal system site. Confirmation of a diagnosis of contact sensitization (allergic contact dermatitis) may require further diagnostic testing.

Patients sensitized from use of Methylphenidate Transdermal System, as evidenced by development of an allergic contact dermatitis, may develop systemic sensitization or other systemic reactions if methylphenidate-containing products are taken via other routes, e.g., orally. Manifestations of systemic sensitization may include a flare-up of previous dermatitis or of prior positive patch-test sites, or generalized skin eruptions in previously unaffected skin. Other systemic reactions may include headache, fever, malaise, arthralgia, diarrhea, or vomiting. No cases of systemic sensitization have been

observed in clinical trials of Methylphenidate Transdermal System.

Patients who develop contact sensitization to Methylphenidate Transdermal System and require oral treatment with methylphenidate should be initiated on oral medication under close medical supervision. It is possible that some patients sensitized to methylphenidate by exposure to Methylphenidate Transdermal System may not be able to take methylphenidate in any form.

5.11 Patients Using External Heat

Patients should be advised to avoid exposing the Methylphenidate Transdermal System application site to direct external heat sources, such as hair dryers, heating pads, electric blankets, heated water beds, etc., while wearing the transdermal system. When heat is applied to Methylphenidate Transdermal System after application, both the rate and extent of absorption are significantly increased. The temperature-dependent increase in methylphenidate absorption can be greater than 2-fold [see *Clinical Pharmacology (12.3)*]. This increased absorption can be clinically significant and can result in overdose of methylphenidate [see *Overdosage (10)*].

5.12 Hematologic Monitoring

Periodic CBC, differential, and platelet counts are advised during prolonged therapy.

5.13 Acute Angle Closure Glaucoma

There have been reports of angle closure glaucoma associated with methylphenidate treatment.

Although the mechanism is not clear, Methylphenidate Transdermal System -treated patients considered at risk for acute angle closure glaucoma (e.g., patients with significant hyperopia) should be evaluated by an ophthalmologist.

5.14 Increased Intraocular Pressure and Glaucoma

There have been reports of an elevation of intraocular pressure (IOP) associated with methylphenidate treatment [see *Adverse Reactions (6.2)*].

Prescribe Methylphenidate Transdermal System to patients with open-angle glaucoma or abnormally increased IOP only if the benefit of treatment is considered to outweigh the risk. Closely monitor Methylphenidate Transdermal System-treated patients with a history of abnormally increased IOP or open angle glaucoma.

5.15 Motor and Verbal Tics, and Worsening of Tourette's Syndrome

CNS stimulants, including methylphenidate, have been associated with the onset or exacerbation of motor and verbal tics. Worsening of Tourette's syndrome has also been reported [see *Adverse Reactions (6.2)*].

Before initiating Methylphenidate Transdermal System, assess the family history and clinically evaluate patients for tics or Tourette's syndrome. Regularly monitor Methylphenidate Transdermal System -treated patients for the emergence or worsening of tics or Tourette's syndrome, and discontinue treatment if clinically appropriate.

6 ADVERSE REACTIONS

Detailed information on serious and adverse reactions of particular importance is provided in the *Boxed Warning* and *Warnings and Precautions (5)* sections:

- Abuse, Misuse, and Addiction [see *Boxed Warning*]
- Hypersensitivity to Methylphenidate [see *Contraindications (4.1)*]
- Monoamine Oxidase Inhibitors [see *Contraindications (4.2)* and *Drug Interactions*]

6.1 Clinical Trials Experience

Because clinical trials are conducted under widely varying conditions, adverse reaction rates observed in the clinical trials of a drug cannot be directly compared to rates in the clinical trials of another drug and may not reflect the rates observed in practice.

The most commonly reported (frequency $\geq 5\%$ and twice the rate of placebo) adverse reactions in a controlled trial in children aged 6-12 included appetite decreased, insomnia, nausea, vomiting, weight decreased, tic, affect lability, and anorexia. The most commonly reported (frequency $\geq 5\%$ and twice the rate of placebo) adverse reactions in a controlled trial in adolescents aged 13-17 were appetite decreased, nausea, insomnia, weight decreased, dizziness, abdominal pain, and anorexia [see Adverse Reactions (6.1)].

The most common ($\geq 2\%$ of subjects) adverse reaction associated with discontinuations in double-blind clinical trials in children or adolescents was application site reactions [see Adverse Reactions (6.1)].

The overall Methylphenidate Transdermal System development program included exposure to Methylphenidate Transdermal System in a total of 2,152 participants in clinical trials, including 1,529 children aged 6-12, 223 adolescents aged 13-17, and 400 adults. The 1,752 child and adolescent subjects aged 6-17 years were evaluated in 10 controlled clinical studies, 7 open-label clinical studies, and 5 clinical pharmacology studies. In a combined studies pool of children using Methylphenidate Transdermal System with a wear time of 9 hours, 212 subjects were exposed for ≥ 6 months and 115 were exposed for ≥ 1 year; 85 adolescents were exposed for ≥ 6 months. Most patients studied were exposed to Methylphenidate Transdermal System transdermal system sizes of 12.5 cm², 18.75 cm², 25 cm² or 37.5 cm², with a wear time of 9 hours.

In the data presented below, the adverse reactions reported during exposure were obtained primarily by general inquiry at each visit, and were recorded by the clinical investigators using terminology of their own choosing. Consequently, it is not possible to provide a meaningful estimate of the proportion of individuals experiencing adverse reactions without first grouping similar types of events into a smaller number of standardized event categories.

Adverse Reactions in Clinical Studies with Discontinuation of Treatment

In a 7-week double-blind, parallel-group, placebo-controlled study in children with ADHD conducted in the outpatient setting, 7.1% (7/98) of patients treated with Methylphenidate Transdermal System discontinued due to adverse events compared

with 1.2% (1/85) receiving placebo. The most commonly reported ($\geq 1\%$ and twice the rate of placebo) adverse reactions leading to discontinuation in the Methylphenidate Transdermal System group were application site reaction (2%), tics (1%), headache (1%), and irritability (1%).

In a 7-week double-blind, parallel-group, placebo-controlled study in adolescents with ADHD conducted in the outpatient setting, 5.5% (8/145) of patients treated with Methylphenidate Transdermal System discontinued due to adverse reactions compared with 2.8% (2/72) receiving placebo. The most commonly reported adverse reactions leading to discontinuation in the Methylphenidate Transdermal System group were application site reaction (2%) and decreased appetite/anorexia (1.4%).

Commonly Observed Adverse Reactions in Double-Blind, Placebo-Controlled Trials

Skin Irritation and Application Site Reactions

Methylphenidate Transdermal System is a dermal irritant. In addition to the most commonly reported adverse reactions presented in Table 2, the majority of subjects in those studies had minimal to definite skin erythema at the Methylphenidate Transdermal System application site. This erythema generally caused no or minimal discomfort and did not usually interfere with therapy or result in discontinuation from treatment. Erythema is not by itself a manifestation of contact sensitization. However, contact sensitization should be suspected if erythema is accompanied by evidence of a more intense local reaction (edema, papules, vesicles) that does not significantly improve within 48 hours or spreads beyond the transdermal system site [see *Warnings and Precautions (5.10)*].

Most Commonly Reported Adverse Reactions

Table 2 lists treatment-emergent adverse reactions reported in $\geq 1\%$ Methylphenidate Transdermal System -treated children or adolescents with ADHD in two 7 week double-blind, parallel-group, placebo-controlled studies conducted in the outpatient setting. Overall, in these studies, 75.5% of children and 78.6% of adolescents experienced at least 1 adverse event.

Table 2 Number (%) of Subjects with Commonly Reported Adverse Reactions ($\geq 1\%$ in the Methylphenidate Transdermal System Group) in 7-Week Placebo-controlled Studies in Either Children or Adolescents - Safety Population

System Organ Class Preferred Term	Adolescents		Children	
	Placebo N = 72	Methylphenidate Transdermal System N = 145	Placebo N = 85	Methylphenidate Transdermal System N = 98

* Six subjects had affect lability, all judged as mild and described as increased emotionally sensitive, emotionality, emotional instability, emotional lability, and intermittent emotional

Adverse Reactions in Studies with the Long-Term Use of Methylphenidate Transdermal System

In a long-term open-label study of up to 12 months duration in 326 children wearing Methylphenidate Transdermal System 9 hours daily, the most common ($\geq 10\%$) adverse reactions were decreased appetite, headache, and weight decreased. A total of 30 subjects (9.2%) were withdrawn from the study due to adverse events and 22 additional subjects (6.7%) discontinued treatment as the result of an application site reaction. Other than application site reactions, affect lability (5 subjects, 1.5%) was the only additional adverse reaction leading to discontinuation reported with a frequency of greater than 1%.

In a long-term open-label study of up to 6 months duration in 162 adolescents wearing Methylphenidate Transdermal System 9 hours daily, the most common ($\geq 10\%$) adverse reactions were decreased appetite and headache. A total of 9 subjects (5.5%) were withdrawn from the study due to adverse events and 3 additional subjects (1.9%) discontinued treatment as the result of an application site reaction. Other adverse reactions leading to discontinuation that occurred with a frequency of greater than 1% included affect lability and irritability (2 subjects each, 1.2%).

6.2 Postmarketing Experience

In addition, the following adverse reactions have been identified during the post-approval use of Methylphenidate Transdermal System. Because these reactions are reported voluntarily from a population of uncertain size, it is not possible to reliably estimate their frequency or establish a causal relationship to Methylphenidate Transdermal System exposure.

Cardiac Disorders: palpitations.

Eye Disorders: visual disturbances, blurred vision, increased intraocular pressure, mydriasis, and accommodation disorder.

General Disorders and Administration Site Disorders: fatigue, application site reactions such as bleeding, bruising, burn, burning, dermatitis, discharge, discoloration, discomfort, dryness, eczema, edema, erosion, erythema, excoriation, exfoliation, fissure, hyperpigmentation, hypopigmentation, induration, infection, inflammation, irritation, pain, papules, paresthesia, pruritus, rash, scab, swelling, ulcer, urticaria, vesicles, and warmth.

Immune System Disorders: hypersensitivity reactions including generalized erythematous and urticarial rashes, allergic contact dermatitis, angioedema, and anaphylaxis.

Investigations: blood pressure increased.

Nervous System Disorders: convulsion, dyskinesia, lethargy, somnolence, serotonin

syndrome in combination with serotonergic drugs, and extrapyramidal disorder, motor and verbal tics.

Psychiatric Disorders: depression, hallucination, nervousness, and libido changes.

Skin and Subcutaneous Tissue Disorders: alopecia.

Adverse Reactions with Oral Methylphenidate Products

Nervousness and insomnia are the most common adverse reactions reported with other methylphenidate products. In children, loss of appetite, abdominal pain, weight loss during prolonged therapy, insomnia, and tachycardia may occur more frequently; however, any of the other adverse reactions listed below may also occur.

Other reactions include:

Cardiac Disorders: angina, arrhythmia, and pulse increased or decreased.

Immune System Disorders: hypersensitivity reactions including skin rash, urticaria, fever, arthralgia, exfoliative dermatitis, erythema multiforme with histopathological findings of necrotizing vasculitis, and thrombocytopenic purpura.

Metabolism and Nutrition Disorders: anorexia and weight loss during prolonged therapy.

Nervous System Disorders: drowsiness, rare reports of Tourette's syndrome and toxic psychosis.

Very rare reports of neuroleptic malignant syndrome (NMS) have been received, and, in most of these, patients were concurrently receiving therapies associated with NMS. In a single report, a ten-year-old boy who had been taking methylphenidate for approximately 18 months experienced an NMS-like event within 45 minutes of ingesting his first dose of venlafaxine. It is uncertain whether this case represented a drug-drug interaction, a response to either drug alone, or some other cause.

Vascular Disorders: blood pressure increased or decreased and cerebral arteritis and/or occlusion.

Although a definite causal relationship has not been established, the following have been reported in patients taking methylphenidate:

Blood and Lymphatic System Disorders: leukopenia and/or anemia.

Hepatobiliary Disorders: abnormal liver function, ranging from transaminase elevation to severe hepatic injury.

Psychiatric Disorders: transient depressed mood.

Skin and Subcutaneous Tissue Disorders: scalp hair loss.

Musculoskeletal and Connective Tissue Disorders: rhabdomyolysis.

7 DRUG INTERACTIONS

7.1 Monoamine Oxidase Inhibitors (MAOI)

Concomitant use of MAOIs and CNS stimulants, including Methylphenidate Transdermal System, can cause hypertensive crisis. Potential outcomes include death, stroke, myocardial infarction, aortic dissection, ophthalmological complications, eclampsia, pulmonary edema, and renal failure [see *Contraindications (4.2)*]. Concomitant use of Methylphenidate Transdermal System with MAOIs or within 14 days after discontinuing MAOI treatment is contraindicated.

7.2 Antihypertensive Drugs

Methylphenidate Transdermal System may decrease the effectiveness of drugs used to treat hypertension. Monitor blood pressure and adjust the dosage of the antihypertensive drug as needed [see *Warnings and Precautions (5.2)*].

7.3 Coumarin Anticoagulants, Antidepressants, and Selective Serotonin Reuptake Inhibitors

Human pharmacologic studies have shown that methylphenidate may inhibit the metabolism of coumarin anticoagulants, anticonvulsants (e.g., phenobarbital, phenytoin, primidone), and some tricyclic drugs (e.g., imipramine, clomipramine, desipramine) and selective serotonin reuptake inhibitors. Downward dose adjustments of these drugs may be required when given concomitantly with methylphenidate. It may be necessary to adjust the dosage and monitor plasma drug concentrations (or, in the case of coumarin, coagulation times), when initiating or discontinuing methylphenidate.

7.4 Halogenated Anesthetics

Concomitant use of halogenated anesthetics and methylphenidate may increase the risk of sudden blood pressure and heart rate increase during surgery. Avoid use of Methylphenidate Transdermal System in patients being treated with anesthetics on the day of surgery.

7.5 Risperidone

Combined use of methylphenidate with risperidone when there is a change in dosage, whether an increase or decrease, of either or both medications, may increase the risk of extrapyramidal symptoms (EPS). Monitor for signs of EPS.

8 USE IN SPECIFIC POPULATIONS

8.1 Pregnancy

Pregnancy Exposure Registry

There is a pregnancy exposure registry that monitors pregnancy outcomes in women exposed to ADHD medications, including Methylphenidate Transdermal System, during pregnancy. Healthcare providers are encouraged to register patients by calling the National Pregnancy Registry for ADHD Medications at 1-866-961-2388 or visit <https://womensmentalhealth.org/adhd-medications/>.

Risk Summary

Published studies and post-marketing reports on methylphenidate use during pregnancy are insufficient to identify a drug-associated risk of major birth defects, miscarriage or adverse maternal or fetal outcomes. There are risks to the fetus associated with the use of CNS stimulants during pregnancy (see *Clinical Considerations*).

No effects on morphological development were observed in embryo-fetal development studies with oral administration of methylphenidate to pregnant rats and rabbits during organogenesis. However, spina bifida was observed in rabbits when given oral doses of 200 mg/kg/day. When methylphenidate was administered orally to rats throughout pregnancy and lactation, offspring growth and survival were decreased at maternally toxic doses (see *Data*).

The estimated background risk of major birth defects and miscarriage for the indicated population is unknown. All pregnancies have a background risk of birth defect, loss, or other adverse outcomes. In the U.S. general population, the estimated background risk of major birth defects and miscarriage in clinical recognized pregnancies is 2-4% and 15-20%, respectively.

Clinical Considerations

Fetal/Neonatal adverse reactions

CNS stimulants, such as Methylphenidate Transdermal System, can cause vasoconstriction and thereby decrease placental perfusion. No fetal and/or neonatal adverse reactions have been reported with the use of therapeutic doses of methylphenidate during pregnancy; however, premature delivery and low birth weight infants have been reported in amphetamine-dependent mothers.

Data

Animal Data

Animal reproduction toxicity studies with transdermal methylphenidate have not been performed. In embryo-fetal development studies conducted in rats and rabbits, methylphenidate was administered orally to pregnant animals during the period of organogenesis, at doses up to 100 and 200 mg/kg/day, respectively. No evidence of morphological development effects was found either of the species; however, increased incidences of fetal skeletal variations were observed in rats at 60 mg/kg or greater and an increase in fetal visceral variations was seen in rabbits at the highest dose. In a previous study, methylphenidate was shown to have malformations (increased incidence of fetal spina bifida) in rabbits when given oral doses of 200 mg/kg/day. When methylphenidate was administered orally to rats throughout pregnancy and lactation at doses of up to 60 mg/kg/day, offspring growth and survival were decreased at maternally toxic doses.

In a study in which oral methylphenidate was given to rats throughout pregnancy and lactation at doses up to 60 mg/kg/day, offspring weights and survival were decreased at 40 mg/kg/day and above; these doses caused some maternal toxicity.

8.2 Lactation

Risk Summary

Limited published literature, based on breast milk sampling from five mothers, reports that methylphenidate is present in human milk, which resulted in infant doses of 0.16% to 0.7% of the maternal weight-adjusted dosage and a milk/plasma ratio ranging between 1.1 and 2.7. There are no reports of adverse effects on the breastfed infant and no effects on milk production. Long-term neurodevelopmental effects on infants from stimulant exposure are unknown. The developmental and health benefits of breastfeeding should be considered along with the mother's clinical need for Methylphenidate Transdermal System and any potential adverse effects on the breastfed infant from Methylphenidate Transdermal System or from the underlying maternal condition.

Clinical Considerations

Monitor breastfeeding infants for adverse reactions, such as agitation, insomnia, anorexia, and reduced weight gain.

8.4 Pediatric Use

The safety and effectiveness of Methylphenidate Transdermal System have not been established in pediatric patients below the age of 6 years.

In studies evaluating extended-release methylphenidate products, patients 4 to <6 years of age had higher systemic methylphenidate exposures than those observed in older pediatric patients at the same dosage. Pediatric patients 4 to <6 years of age also had a higher incidence of adverse reactions, including weight loss.

The safety and effectiveness of Methylphenidate Transdermal System for the treatment

of ADHD have been established in pediatric patients 6 to 17 years.

Long Term Suppression of Growth

Growth should be monitored during treatment with stimulants, including Methylphenidate Transdermal System. Children who are not growing or gaining weight as expected may need to have their treatment interrupted [see *Warnings and Precautions (5.8)*].

Juvenile Animal Toxicity Data

Rats treated with methylphenidate early in the postnatal period through sexual maturation demonstrated a decrease in spontaneous locomotor activity in adulthood. A deficit in acquisition of a specific learning task was observed in females only.

Studies with transdermal methylphenidate have not been performed in juvenile animals. In a study conducted in young rats, methylphenidate was administered orally at doses of up to 100 mg/kg/day for 9 weeks, starting early in the postnatal period (Postnatal Day 7) and continuing through sexual maturity (Postnatal Week 10). When these animals were tested as adults (Postnatal Weeks 13-14), decreased spontaneous locomotor activity was observed in males and females previously treated with 50 mg/kg/day or greater, and a deficit in the acquisition of a specific learning task was seen in females exposed to the highest dose. The no effect level for juvenile neurobehavioral development in rats was 5 mg/kg/day. The clinical significance of the long-term behavioral effects observed in rats is unknown.

8.5 Geriatric Use

Methylphenidate Transdermal System has not been studied in patients greater than 65 years of age.

9 DRUG ABUSE AND DEPENDENCE

9.1 Controlled Substance

Methylphenidate Transdermal System contains methylphenidate, a Schedule II controlled substance.

9.2 Abuse

Methylphenidate Transdermal System has a high potential for abuse and misuse which can lead to the development of a substance use disorder, including addiction [see *Warnings and Precautions (5.1)*]. Methylphenidate Transdermal System can be diverted for non-medical use into illicit channels or distribution.

Abuse is the intentional non-therapeutic use of a drug, even once, to achieve a desired psychological or physiological effect. Misuse is the intentional use, for therapeutic purposes, of a drug by an individual in a way other than prescribed by a health care provider or for whom it was not prescribed. Drug addiction is a cluster of behavioral, cognitive, and physiological phenomena that may include a strong desire to take the drug, difficulties in controlling drug use (e.g., continuing drug use despite harmful consequences, giving a higher priority to drug use than other activities and obligations), and possible tolerance or physical dependence.

Misuse and abuse of methylphenidate may cause increased heart rate, respiratory rate, or blood pressure; sweating; dilated pupils; hyperactivity; restlessness; insomnia; decreased appetite; loss of coordination; tremors; flushed skin; vomiting; and/or abdominal pain. Anxiety, psychosis, hostility, aggression, and suicidal or homicidal ideation have also been observed with CNS stimulants abuse and/or misuse. Misuse and abuse of CNS stimulants, including Methylphenidate Transdermal System, can result in

overdose and death [see *Overdosage (10)*], and this risk is increased with higher doses or unapproved methods of administration, such as snorting or injection.

9.3 Dependence

Physical Dependence

Methylphenidate Transdermal System may produce physical dependence. Physical dependence is a state that develops as a result of physiological adaptation in response to repeated drug use, manifested by withdrawal signs and symptoms after abrupt discontinuation or a significant dose reduction of a drug.

Withdrawal signs and symptoms after abrupt discontinuation or dose reduction following prolonged use of CNS stimulants including Methylphenidate Transdermal System include dysphoric mood; depression; fatigue; vivid, unpleasant dreams; insomnia or hypersomnia; increased appetite; and psychomotor retardation or agitation.

Tolerance

Methylphenidate Transdermal System may produce tolerance. Tolerance is a physiological state characterized by a reduced response to a drug after repeated administration (i.e., a higher dose of a drug is required to produce the same effect that was once obtained at a lower dose).

10 OVERDOSAGE

Clinical Effects of Overdose

Overdose of CNS stimulants is characterized by the following sympathomimetic effects:

- Cardiovascular effects including tachyarrhythmias, and hypertension or hypotension. Vasospasm, myocardial infarction, or aortic dissection may precipitate sudden cardiac death. Takotsubo cardiomyopathy may develop.
- CNS effects including psychomotor agitation, confusion, and hallucinations. Serotonin syndrome, seizures, cerebral vascular accidents, and coma may occur.
- Life-threatening hyperthermia (temperatures greater than 104°F) and rhabdomyolysis may develop.

Overdose Management

Consider the possibility of multiple drug ingestion. Because methylphenidate has a large volume of distribution and is rapidly metabolized, dialysis is not useful. Remove all transdermal systems immediately and cleanse the area(s) to remove any remaining adhesive. The continuing absorption of methylphenidate from the skin, even after removal of the transdermal system, should be considered when treating patients with overdose.

Consider contacting the Poison Help line (1-800-222-1222) or a medical toxicologist for additional overdose management recommendations.

11 DESCRIPTION

Methylphenidate Transdermal System is an adhesive-based matrix transdermal system containing methylphenidate that is applied to intact skin. The chemical name for methylphenidate is α -phenyl-2-piperidineacetic acid methyl ester. It is a white to off-white powder and is soluble in alcohol, ethyl acetate, and ether. Methylphenidate is practically insoluble in water and petrol ether. Its molecular weight is 233.31. Its empirical formula is C₁₄H₁₉NO₂. The structural formula of methylphenidate is:

Transdermal System Components

Methylphenidate Transdermal System contains methylphenidate in a multipolymeric adhesive. The methylphenidate is dispersed in acrylic adhesive that is dispersed in a silicone adhesive. The composition per unit area of all dosage strengths is identical, and the total dose delivered is dependent on the transdermal system size and wear time.

Methylphenidate Transdermal System consists of three layers, as seen in the figure below (cross-section of the transdermal system).

Proceeding from the outer surface toward the surface adhering to the skin, the layers are (1) a polyester/ethylene vinyl acetate laminate film backing, (2) a proprietary adhesive formulation incorporating Noven Pharmaceuticals, Inc.'s DOT Matrix™ transdermal technology consisting of an acrylic adhesive, a silicone adhesive, and methylphenidate, and (3) a fluoropolymer-coated polyester protective liner, which is attached to the adhesive surface and must be removed before the transdermal system can be used.

The active component of the transdermal system is methylphenidate. The remaining components are pharmacologically inactive.

12 CLINICAL PHARMACOLOGY

12.1 Mechanism of Action

Methylphenidate is a CNS stimulant. Its mode of therapeutic action in ADHD is not known.

12.2 Pharmacodynamics

Methylphenidate is a racemic mixture comprised of the *d*- and *l*-enantiomers. The *d*-enantiomer is more pharmacologically active than the *l*-enantiomer. Methylphenidate blocks the reuptake of norepinephrine and dopamine into the presynaptic neuron and increases the release of these monoamines into the extraneuronal space.

12.3 Pharmacokinetics

The pharmacokinetics of Methylphenidate Transdermal System when applied to the hip for 9 hours have been studied in ADHD patients 6 to 17 years old.

Absorption

The amount of methylphenidate absorbed systemically is a function of both wear time and transdermal system size. In patients with ADHD, peak plasma levels of methylphenidate are reached at about 10 hours after single application and 8 hours after repeat transdermal system applications (12.5cm² to 37.5cm²) when worn up to 9 hours.

On single dosing of children or adolescents with Methylphenidate Transdermal System, there was a delay of, on average, 2 hours before *d*-methylphenidate was detectable in the circulation. On repeat dosing, low concentrations (1.2-3.0 ng/mL in children and 0.5-1.7ng/mL in adolescents, on average across the dose range) were observed earlier in the profile, due to carry-over effect. Following the application of Methylphenidate Transdermal System once daily with a 9-hour wear time, the mean pharmacokinetic parameters of *d*-methylphenidate in children and adolescents with ADHD after 4 weeks of therapy are summarized in Table 3.

Table 3
Mean Plasma d-Methylphenidate Pharmacokinetic Parameters After Repeated 9-Hour Applications of Methylphenidate Transdermal System or Oral ER-MPH for up to 28 days to Pediatric ADHD Patients (Aged 6 - 17 years)

<i>Children</i>				
Parameter	Methylphenidate Transdermal System ¹ 12.5cm ² (N=12)	Methylphenidate Transdermal System ² 37.5cm ² (N=10)	Oral ER-MPH ³ 18mg	Oral ER-MPH ³ 54mg
C _{ssmax} (ng/mL)	15.7 ± 9.39	42.9 ± 22.4	8.37 ± 4.14	26.1 ± 11.2
C _{ssmin} (ng/mL)	1.04 ± 1.17	1.96 ± 1.73	0.708 ± 1.08	1.19 ± 1.54
AUC _{ss} (ng·hr/mL)	163 ± 101	447 ± 230	97.7 ± 67.0	317 ± 160
t _{lag} (h) ₄	0 (0 - 2.0)	0 (0 - 1.0)	0	0
<i>Adolescents</i>				
C _{ssmax} (ng/mL)	8.32 ± 4.60	16.5 ± 6.94	5.23 ± 1.72	18.0 ± 6.97
C _{ssmin} (ng/mL)	0.544 ± 0.383	1.02 ± 0.629	0.360 ± 0.478	1.50 ± 0.937
AUC _{ss} (ng·hr/mL)	85.7 ± 50.0	167 ± 66.0	59.7 ± 19.1	216 ± 80.8
t _{lag} (h) ₄	0 (0 - 2.0)	0 (0 - 2.0)	0	0

¹ Dose maintained fixed for 28 days;

² Dose escalated at 7 day intervals from 12.5 cm² through 18.75 cm² and 25 cm² to 37.5 cm²;

³ Dose escalated at 7 day intervals from 18 mg through 27 mg and 36 mg to 54 mg;

⁴ Median (minimum - maximum); t_{lag} = Last Sampling Time Prior to Time of First Quantifiable Plasma Concentration

Following administration of Methylphenidate Transdermal System 12.5cm² to pediatric and adolescent ADHD patients daily for 7 days, there were 13% and 14% increases, respectively, in steady state area under the plasma concentration-time curve (AUC_{ss}) relative to that anticipated on the basis of single dose pharmacokinetics (AUC_{0-∞}); after 28 days administration, these increments increased to 64% and 76%, respectively. C_{max} increased by nearly 69% and 100% within 4 weeks of daily administration of the starting dose in children and adolescents, respectively.

The observed exposures with Methylphenidate Transdermal System could not be explained by drug accumulation predicted from observed single dose pharmacokinetics and there was no evidence that clearance or rate of elimination changed between single and repeat dosing. Neither were they explainable by differences in dosing patterns between treatments, age, race, or gender. This suggests that transdermal absorption of methylphenidate may increase with repeat dosing with Methylphenidate Transdermal System; on average, steady-state is likely to have been achieved by approximately 14 days of dosing.

In the single- and multiple dose study described above, exposure to *l*-methylphenidate was 46% of the exposure to *d*-methylphenidate in children and 40% in adolescents. *l*-methylphenidate is less pharmacologically active than *d*-methylphenidate [see *Pharmacodynamics (12.2)*].

In a phase 2 PK/PD study in children aged 6-12 years, 2/3 of patients had 2-hour *d*-MPH concentrations < 5 ng/mL on chronic dosing, and at 3 hours 40% of patients had *d*-MPH concentrations < 5 ng/mL [see *Clinical Studies (14)*].

When Methylphenidate Transdermal System is applied to inflamed skin both the rate and extent of absorption are increased as compared with intact skin. When applied to inflamed skin, lag time is no greater than 1 hour, T_{max} is 4 hours, and both C_{max} and AUC are approximately 3-fold higher.

When heat is applied to Methylphenidate Transdermal System after application, both the rate and the extent of absorption are significantly increased. Median T_{lag} occurs 1 hour earlier, T_{max} occurs 0.5 hours earlier, and median C_{max} and AUC are 2-fold and 2.5-fold higher, respectively.

Application sites other than the hip can have different absorption characteristics and have not been adequately studied in safety or efficacy studies.

Dose Proportionality

Following a single 9-hour application of Methylphenidate Transdermal System doses of 10 mg / 9 hours to 30 mg / 9 hours transdermal systems to 34 children with ADHD, C_{max} and AUC_{0-t} of *d*-methylphenidate were proportional to the transdermal system dose. Mean plasma concentration-time plots are shown in Figure 1. C_{max} of *l*-methylphenidate was also proportional to the transdermal system dose. AUC_{0-t} of *l*-methylphenidate was only slightly greater than proportional to transdermal system dose.

FIGURE 1:
Mean Concentration-time Profiles for *d*-Methylphenidate in all Patients (N=34) Following Administration of Single Applications (9-Hour Wear Time) of *d,l*-Methylphenidate Using Daytrana 10 mg (□), 20 mg (◇) and 30 mg (△) per 9-Hour Transdermal System

Distribution

Upon removal of Methylphenidate Transdermal System, methylphenidate plasma concentrations in children with ADHD decline in a biexponential manner. This may be due to continued distribution of MPH from the skin after transdermal system removal.

Metabolism and Excretion

Methylphenidate is metabolized primarily by de-esterification to alpha-phenyl-piperidine acetic acid (ritalinic acid), which has little or no pharmacologic activity.

Transdermal administration of methylphenidate exhibits much less first pass effect than oral administration. Consequently, a much lower dose of Methylphenidate Transdermal System on a mg/kg basis compared to oral dosages may still produce higher exposures of *d*-MPH with transdermal administration compared to oral administration. In addition, very little, if any, *l*-methylphenidate is systemically available after oral administration due to first pass metabolism, whereas after transdermal administration of racemic methylphenidate exposure to *l*-methylphenidate is nearly as high as to *d*-methylphenidate.

The mean elimination $t_{1/2}$ from plasma of *d*-methylphenidate after removal of Methylphenidate Transdermal System in children aged 6 to 12 years and adolescents aged 13-17 years was approximately 4 to 5 hours. The $t_{1/2}$ of *l*-methylphenidate was shorter than for *d*-methylphenidate and ranged from 1.4 to 2.9 hours, on average.

The C_{max} and AUC of *d*-methylphenidate were approximately 50% lower in adolescents, compared to children, following either a 1-day or 7-day administration of Methylphenidate Transdermal System (10mg/9hr). Multiple-dose administration of Methylphenidate Transdermal System did not result in significant accumulation of methylphenidate; following 7 days of Methylphenidate Transdermal System administration (10mg/9hr) in children and adolescents, the accumulation index of methylphenidate was 1.1, based on the mean steady state area under the plasma concentration-time curve (AUC_{ss}) relative to that anticipated on the basis of single dose pharmacokinetics (AUC_{0-∞}).

Food Effects

The pharmacokinetics or the pharmacodynamic food effect performance after application of Methylphenidate Transdermal System has not been studied, but because of the transdermal route of administration, no food effect is expected.

Special Populations

Gender

The pharmacokinetics of methylphenidate after single and repeated doses of Methylphenidate Transdermal System were similar between boys and girls with ADHD, after allowance for differences in body weight.

Race

The influence of race on the pharmacokinetics of methylphenidate after administration of Methylphenidate Transdermal System has not been defined.

Age

The pharmacokinetics of methylphenidate after administration of Methylphenidate Transdermal System have not been studied in children less than 6 years of age.

Renal Impairment

There is no experience with the use of Methylphenidate Transdermal System in patients with renal insufficiency.

Hepatic Impairment

There is no experience with the use of Methylphenidate Transdermal System in patients

with hepatic insufficiency.

13 NONCLINICAL TOXICOLOGY

13.1 Carcinogenesis/Mutagenesis and Impairment of Fertility

Carcinogenesis

Carcinogenicity studies of transdermal methylphenidate have not been performed. In a lifetime carcinogenicity study of oral methylphenidate carried out in B6C3F1 mice, methylphenidate caused an increase in hepatocellular adenomas and, in males only, an increase in hepatoblastomas, at a daily dose of approximately 60 mg/kg/day. Hepatoblastoma is a relatively rare rodent malignant tumor type. There was no increase in total malignant hepatic tumors. The mouse strain used is sensitive to the development of hepatic tumors and the significance of these results to humans is unknown.

Orally administered methylphenidate did not cause any increases in tumors in a lifetime carcinogenicity study carried out in F344 rats; the highest dose used was approximately 45 mg/kg/day.

In a 24-week oral carcinogenicity study in the transgenic mouse strain p53+/-, which is sensitive to genotoxic carcinogens, there was no evidence of carcinogenicity. In this study, male and female mice were fed diets containing the same concentration of methylphenidate as in the lifetime carcinogenicity study; the high-dose groups were exposed to 60 to 74 mg/kg/day of methylphenidate.

Mutagenesis

Methylphenidate was not mutagenic in the *in vitro* Ames reverse mutation assay or in the *in vitro* mouse lymphoma cell forward mutation assay. Sister chromatid exchanges and chromosome aberrations were increased, indicative of a weak clastogenic response, in an *in vitro* assay in cultured Chinese hamster ovary cells. Methylphenidate was negative *in vivo* in males and females in the mouse bone marrow micronucleus assay.

Impairment of Fertility

Methylphenidate did not impair fertility in male or female mice that were fed diets containing the drug in an 18-week continuous breeding study. The study was conducted at doses up to 160 mg/kg/day.

14 CLINICAL STUDIES

Methylphenidate Transdermal System was demonstrated to be effective in the treatment of ADHD in two (2) randomized double-blind, placebo-controlled studies in children aged 6 to 12 years and one (1) randomized, double-blind, placebo-controlled study in adolescents aged 13 to 17 years who met Diagnostic and Statistical Manual (DSM-IV-TR[®]) criteria for ADHD. Methylphenidate Transdermal System wear time was 9 hours in all three (3) studies.

In Study 1, conducted in a classroom setting, symptoms of ADHD were evaluated by school teachers and observers using the Department Subscale from the Swanson, Kotkin, Agler, M-Flynn, and Pelham (SKAMP) rating scale which assesses behavior symptoms in the classroom setting. Methylphenidate Transdermal System was applied for 9 hours before removal. There was a 5-week open-label Methylphenidate Transdermal System dose optimization phase using dosages of 10, 15, 20, and 30 mg / 9 hours, followed by a 2-week randomized, double-blind, placebo-controlled crossover treatment phase using the optimal transdermal system dose for each patient or placebo. The mean differences between Methylphenidate Transdermal System and placebo in change from baseline in SKAMP Department Scores were statistically significant in favor

of Methylphenidate Transdermal System beginning at 2 hours and remained statistically significant at all subsequent measured time points through 12 hours after application of the Methylphenidate Transdermal System.

In Study 2, conducted in the outpatient setting, Methylphenidate Transdermal System or placebo was blindly administered in a flexible-dose design using doses of 10, 15, 20, and 30 mg / 9 hours to achieve an optimal regimen over 5 weeks, followed by a 2-week maintenance period using the optimal transdermal system dose for each patient. Symptoms of ADHD were evaluated by the ADHD-Rating Scale (RS)-IV. Methylphenidate Transdermal System was statistically significantly superior to placebo as measured by the mean change from baseline for the ADHD-RS-IV total score. Although this study was not designed specifically to evaluate dose response, in general there did not appear to be any additional effectiveness accomplished by increasing the transdermal system dose from 20 mg / 9 hours to 30 mg / 9 hours.

In Study 3, conducted in the outpatient setting, Methylphenidate Transdermal System or placebo was blindly administered in a flexible-dose design using doses of 10, 15, 20, and 30 mg / 9 hours during a 5-week dose-optimization phase, followed by a 2-week maintenance period using the optimal transdermal system dose for each patient. Symptoms of ADHD were evaluated using the ADHD-Rating Scale (RS)-IV. Methylphenidate Transdermal System was statistically significantly superior to placebo as measured by the mean change from baseline in the ADHD-RS-IV total score.

16 HOW SUPPLIED/STORAGE AND HANDLING

Methylphenidate Transdermal System is supplied in a sealed tray containing 30 individually pouched transdermal systems. See the chart below for information regarding available strengths.

Nominal Dose Delivered (mg) Over 9 Hours	Dosage Transdermal Rate* (mg/hr)	Transdermal System Size (cm²)	Methylphenidate Content per Transdermal System** (mg)	Transdermal Systems Per Carton	NDC Number
10	1.1	12.5	27.5	30	0574-2410-65
15	1.6	18.75	41.3	30	0574-2415-65
20	2.2	25	55	30	0574-2420-65
30	3.3	37.5	82.5	30	0574-2430-65

*Nominal *in vivo* delivery rate per hour in children and adolescents when applied to the hip, based on a 9-hour wear period.

**Methylphenidate content in each transdermal system.

Store at 25° C (77° F); excursions permitted to 15-30° C (59-86° F) [see USP Controlled Room Temperature]. Do not store transdermal systems unpouched. Do not store transdermal systems in refrigerators or freezers.

Once the sealed tray is opened, use contents within 2 months. Apply the transdermal system immediately upon removal from the individual protective pouch. For transdermal use only.

See the *Patient Counseling Information* (17) for specific disposal instructions for unused or expired Methylphenidate Transdermal System.

17 PATIENT COUNSELING INFORMATION

Advise patients to read the FDA-approved patient labeling (Medication Guide and Instructions for Use).

Abuse, Misuse, and Addiction

Educate patients and their families about the risks of abuse, misuse, and addiction of Methylphenidate Transdermal System, which can lead to overdose and death, and proper disposal of any unused drug [see *Warnings and Precautions (5.1)*, *Drug Abuse and Dependence (9.2)*, *Overdosage (10)*]. Advise patients to store Methylphenidate Transdermal System in a safe place, preferably locked, and instruct patients to not give Methylphenidate Transdermal System to anyone else.

Special Disposal Instructions

Advise patients that there are special disposal instructions for unused or expired Methylphenidate Transdermal System [see *Warnings and Precautions (5.1)*]. Instruct patients to find a take back location to dispose of unused or expired Methylphenidate Transdermal System. If a take back program is unavailable, instruct them to:

1. Remove Methylphenidate Transdermal System from its pouch, separate it from its liner, fold it in half with the adhesive sides touching each other, and immediately flush it down the toilet, and
2. Place the pouch and liner in a container, close the container, and throw out the container in the trash (advise patients not to flush the pouch and liner down the toilet).

Risks to Patients with Serious Cardiac Disease

Advise patients that there are potential risks to patients with serious cardiac disease, including sudden death, with Methylphenidate Transdermal System use. Instruct patients to contact a healthcare provider immediately if they develop symptoms, such as exertional chest pain, unexplained syncope, or other symptoms suggestive of cardiac disease [see *Warnings and Precautions (5.2)*].

Priapism

Advise patients, caregivers, and family members of the possibility of painful or prolonged penile erections (priapism). Instruct the patient to seek immediate medical attention in the event of priapism [see *Warnings and Precautions (5.6)*].

Circulation problems in fingers and toes [Peripheral vasculopathy, including Raynaud's phenomenon] [see *Warnings and Precautions (5.7)*]

- Instruct patients beginning treatment with Methylphenidate Transdermal System about the risk of peripheral vasculopathy, including Raynaud's Phenomenon, and in associated signs and symptoms: fingers or toes may feel numb, cool, painful, and/or may change color from pale, to blue, to red.
- Instruct patients to report to their physician any new numbness, pain, skin color change, or sensitivity to temperature in fingers or toes.
- Instruct patients to call their physician immediately with any signs of unexplained wounds appearing on fingers or toes while using Methylphenidate Transdermal System.
- Further clinical evaluation (e.g., rheumatology referral) may be appropriate for certain patients.

Long-Term Suppression of Growth in Pediatric Patients

Advise patients that Methylphenidate Transdermal System may cause slowing of growth including weight loss [see *Warnings and (5.8)*].

Chemical Leukoderma

Advise patients of the possibility of a persistent loss of skin pigmentation at, around and distant from the application site. Advise patients to immediately inform their healthcare provider if changes in skin pigmentation occur [see *Warnings and Precautions (5.9)*].

Increased Intraocular Pressure (IOP) and Glaucoma

Advise patients that IOP and glaucoma may occur during treatment with Methylphenidate Transdermal System [see *Warnings and Precautions (5.14)*].

Motor and Verbal Tics, and Worsening of Tourette's Syndrome

Advise patients that motor and verbal tics and worsening of Tourette's Syndrome may occur during treatment with Methylphenidate Transdermal System. Instruct patients to notify their healthcare provider if emergence of new tics or worsening of tics or Tourette's syndrome occurs [see *Warnings and Precautions (5.15)*].

Important Preparation and Administration Instructions [see *Dosage and Administration (2.3)*]

- Parents and patients should be informed to apply Methylphenidate Transdermal System to a clean, dry site on the hip, which is not oily, damaged, or irritated. The site of application must be alternated daily. Methylphenidate Transdermal System should not be applied to the waistline, or where tight clothing may rub it.
- If patients or caregivers experience difficulty separating the transdermal system from the release liner or observe tearing and/or other damage to the transdermal system during removal from the liner, the transdermal system should be discarded according to the directions provided in this label, and a new transdermal system should be applied [see *Dosage and Administration (2.3)*]. Patients or caregivers should inspect the release liner to ensure that no adhesive containing medication has transferred to the liner. If adhesive transfer has occurred, the transdermal system should be discarded.
- Methylphenidate Transdermal System should be applied 2 hours before the desired effect. Methylphenidate Transdermal System should be removed approximately 9 hours after it is applied, although the effects from the transdermal system will last for several more hours. Methylphenidate Transdermal System may be removed earlier than 9 hours if a shorter duration of effect is desired or late day side effects appear.
- The parent or caregiver should be encouraged to use the administration chart included with each carton of Methylphenidate Transdermal System to monitor application and removal time, and method of disposal. The Medication Guide included at the end of this insert also includes a timetable to calculate when to remove Methylphenidate Transdermal System, based on the 9 hour application time.
- Patients or caregivers should avoid touching the adhesive side of the transdermal system during application, in order to avoid absorption of methylphenidate. If they do touch the adhesive side of the transdermal system, they should immediately wash their hands after application.
- In the event that a Methylphenidate Transdermal System does not fully adhere to the skin upon application, or is partially or fully detached during wear time, the transdermal system should be discarded according to the directions provided in this label, and a new transdermal system should be applied [see *Dosage and Administration (2.3)*]. If a transdermal system is replaced, the total recommended wear time for that day should remain 9 hours, regardless of the number of transdermal systems used.
- Methylphenidate Transdermal System should not be applied or re-applied with dressings, tape, or other common adhesives.
- Exposure to water during bathing, swimming, or showering can affect Methylphenidate Transdermal System adherence.
- Do not cut transdermal systems. Only intact transdermal systems should be applied.

- If there is an unacceptable duration of appetite loss or insomnia in the evening, taking the transdermal system off earlier may be attempted before decreasing the transdermal system dose.
- Skin redness or itching is common with Methylphenidate Transdermal System and small bumps on the skin may also occur in some patients. If any swelling or blistering occurs the Methylphenidate Transdermal System should not be worn and the patient should be seen by the prescriber. Patients or caregivers should not apply hydrocortisone or other solutions, creams, ointments, or emollients immediately prior to Methylphenidate Transdermal System application, since the effect on transdermal system adhesion and methylphenidate absorption has not been established. The potential adverse effects of topical corticosteroid use during treatment with Methylphenidate Transdermal System are unknown.

Recommended Storage Instructions

Transdermal systems should be stored at 25 degrees Celsius (77 degrees Fahrenheit) with excursions permitted that do not exceed 15 to 30 degrees Celsius (59 to 86 degrees Fahrenheit) [see How Supplied/Storage and Handling (16)]. Patients or caregivers should be advised not to store Methylphenidate Transdermal System in the refrigerator or freezer.

Pregnancy Registry

Advise patients that there is a pregnancy exposure registry that monitors pregnancy outcomes in women exposed to ADHD medications, including Methylphenidate Transdermal System, during pregnancy [see Use in Specific Populations (8.1)].

MEDICATION GUIDE
Methylphenidate (meth-uhl-FEN-i-deyt) Transdermal System, CII
Important: Methylphenidate Transdermal System is for use on the skin only.
What is the most important information I should know about Methylphenidate Transdermal System?
Methylphenidate Transdermal System may cause serious side effects, including:
<ul style="list-style-type: none"> • Abuse, misuse, and addiction. Methylphenidate Transdermal System has a high chance for abuse and misuse and may lead to substance use problems, including addiction. Misuse and abuse of Methylphenidate Transdermal System, other methylphenidate containing medicines, and amphetamine containing medicines, can lead to overdose and death. The risk of overdose and death is increased with higher doses of Methylphenidate Transdermal System or when it is used in ways that are not approved, such as snorting or injection. <ul style="list-style-type: none"> ◦ Your healthcare provider should check your child's risk for abuse, misuse, and addiction before starting treatment with Methylphenidate Transdermal System and

will monitor your child during treatment.

- Methylphenidate Transdermal System may lead to physical dependence after prolonged use, even if taken as directed by your healthcare provider.
 - Do not give Methylphenidate Transdermal System to anyone else. See "**What is Methylphenidate Transdermal System?**" for more information.
 - Keep Methylphenidate Transdermal System in a safe place and properly dispose of any unused medicine. See "**How should I store Methylphenidate Transdermal System?**" for more information.
 - Tell your healthcare provider if your child has ever abused or been dependent on alcohol, prescription medicines, or street drugs.
- **Risks for people with serious heart disease.** Sudden death has happened in people who have heart defects or other serious heart disease. Your child's healthcare provider should check your child carefully for blood pressure and heart problems before starting treatment with and while you are using Methylphenidate Transdermal System. Tell your child's healthcare provider if your child has any heart problems, heart disease or heart defects.
Remove the Methylphenidate Transdermal System transdermal system (patch) and call your child's healthcare provider or go to the nearest emergency room right away if your child has any signs of heart problems such as chest pain, shortness of breath, or fainting during treatment with Methylphenidate Transdermal System.
 - **Increased blood pressure and heart rate.** Your child's healthcare provider should check your child's blood pressure and heart rate regularly during treatment with Methylphenidate Transdermal System.
 - **Mental (psychiatric) problems, including:**
 - new or worse behavior or thought problems
 - new or worse bipolar illness
 - new psychotic symptoms (such as hearing voices, or seeing or believing things that are not real) or manic symptomsTell your child's healthcare provider about any mental problems your child has or about a family history of suicide, bipolar illness, or depression.
Call your child's healthcare provider right away if your child has any new or worsening mental symptoms or problems during treatment with Methylphenidate Transdermal System, especially hearing voices, seeing, or believing things that are not real, or new manic symptoms.

What is Methylphenidate Transdermal System?

Methylphenidate Transdermal System is a central nervous system (CNS) stimulant prescription medication used for the treatment of Attention Deficit Hyperactivity Disorder (ADHD) in children 6 to 17 years of age. Methylphenidate Transdermal System may help increase attention and decrease impulsiveness and hyperactivity in children with ADHD.

Methylphenidate Transdermal System is not recommended for use in children under 6 years of age with ADHD.

Methylphenidate Transdermal System is a federally controlled substance (CII) because it contains methylphenidate that can be a target for people who abuse prescription medicines or street drugs. Keep Methylphenidate Transdermal System in a safe place to protect it from theft. Never give your Methylphenidate Transdermal System to anyone else because it may cause death or harm them. Selling or giving away Methylphenidate Transdermal System may harm others and is against the law.

Do not use Methylphenidate Transdermal System if your child:

- is allergic to methylphenidate or any of the ingredients in Methylphenidate Transdermal System. See the end of this Medication Guide for a complete list of ingredients in Methylphenidate Transdermal System.

- is taking, or has stopped taking within the past 14 days, a medicine used to treat depression called a monoamine oxidase inhibitor (MAOI)

Before using Methylphenidate Transdermal System, tell your child's healthcare provider about all of your child's medical conditions, including if your child:

- has heart problems, heart disease, heart defects, or high blood pressure
- has mental problems including psychosis, mania, bipolar illness, or depression, or has a family history of suicide bipolar illness, or depression
- has seizures or have had an abnormal brain wave test (EEG)
- has circulation problems in fingers or toes
- has skin problems such as eczema or psoriasis, or have skin reactions to soaps, lotions, make-up, or adhesives (glues)
- has a history of vitiligo or a family history of vitiligo
- has eye problems, including increased pressure in your eye, glaucoma, or problems with your close-up vision (farsightedness)
- has or had repeated movements or sounds (tics) or Tourette's syndrome, or have a family history of tics or Tourette's syndrome
- is pregnant or plans to become pregnant. It is not known if Methylphenidate Transdermal System will harm the unborn baby. Tell your child's healthcare provider if your child becomes pregnant during treatment with Methylphenidate Transdermal System.
 - There is a pregnancy registry for females who are exposed to Methylphenidate Transdermal System during pregnancy. The purpose of the registry is to collect information about the health of women exposed to Methylphenidate Transdermal System and their baby. If your child becomes pregnant during treatment with Methylphenidate Transdermal System, talk to your child's healthcare provider about registering with the National Pregnancy Registry of Psychostimulants at 1-866-961-2388 or visit online at <https://womensmentalhealth.org/adhd-medications/>.
- is breast feeding or plan to breast feed. Methylphenidate Transdermal System passes into breast milk. Talk to your child's healthcare provider about the best way to feed the baby during treatment with Methylphenidate Transdermal System.
- a history of vitiligo and/or a family history of vitiligo

Tell your child's healthcare provider about all of the medicines your child takes, including prescription and over-the-counter medicines, vitamins, and herbal supplements.

Methylphenidate Transdermal System and some medicines may interact with each other and cause serious side effects. Sometimes the doses of other medicines will need to be changed during treatment with Methylphenidate Transdermal System. Your child's healthcare provider will decide if Methylphenidate Transdermal System can be taken with other medicines.

Especially tell your child's healthcare provider if your child takes:

- blood pressure medicines (anti-hypertensive)

Know the medicines that your child takes. Keep a list of your child's medicines with you to show your child's healthcare provider and pharmacist when your child gets a new medicine. **Do not start any new medicine while using Methylphenidate**

Transdermal System without first talking to your child's healthcare provider.

How should Methylphenidate Transdermal System be used?

- See the detailed **“Instructions for Use”** at the end of this Medication Guide for information about the right way to apply, remove, and dispose of Methylphenidate Transdermal System.
- Use Methylphenidate Transdermal System exactly as prescribed by your child's healthcare provider.

- Your child's healthcare provider may change the dose if needed.
- Apply Methylphenidate Transdermal System to the hip area 2 hours before an effect is needed and remove Methylphenidate Transdermal System within 9 hours after it is applied. **Do not** wear Methylphenidate Transdermal System longer than 9 hours a day.
- If Methylphenidate Transdermal System falls off, a new patch may be applied to a different area of the same hip.
- If you forget to apply Methylphenidate Transdermal System at your usual scheduled time each day, you may apply the patch later in the day. The patch should be removed at the usual time of day to lower the chance of side effects later in the day.
- If your child has loss of appetite or trouble sleeping in the evening, ask your child's healthcare provider if your child can take the patch off earlier in the day.
- Contact with water while bathing, swimming, or showering can make the patch not stick well.
- **Do not** use bandages, tape, or other household adhesives (glue) to hold the patch onto the skin.

If your child uses too much Methylphenidate Transdermal System transdermal systems call your healthcare provider or Poison Help line at 1-800-222-1222 or go to the nearest hospital emergency room right away.

What should your child avoid while using Methylphenidate Transdermal System?

- After applying the Methylphenidate Transdermal System patch, avoid exposing the application site to direct external heat sources, such as hair dryers, heating pads, electric blankets, heated water beds or other heat sources. Exposure to heat can cause too much medicine to pass into the body and cause serious side effects.

What are the possible side effects of Methylphenidate Transdermal System? Methylphenidate Transdermal System may cause serious side effects, including:

- See "**What is the most important information I should know about Methylphenidate Transdermal System?**"
- **Seizures.** Your child's healthcare provider may stop treatment with Methylphenidate Transdermal System if your child has a seizure.
- **Painful and prolonged erections (priapism).** Priapism that may require surgery has happened in people who take products that contain methylphenidate. **If your child develops priapism, get medical help right away.**
- **Circulation problems in fingers and toes (peripheral vasculopathy, including Raynaud's phenomenon). Signs and symptoms may include:**
 - fingers or toes may feel numb, cool, or painful
 - fingers and toes may change color from pale, to blue, to red

Tell your child's healthcare provider if your child has any numbness, pain, skin color change, or sensitivity to temperature in the fingers or toes.

Call your healthcare provider right away if your child has any signs of unexplained wounds appearing on fingers or toes during treatment with Methylphenidate Transdermal System.
- **Slowing of growth (height and weight) in children.** Your child should have their height and weight checked often during treatment with Methylphenidate Transdermal System. Your healthcare provider may stop your child's Methylphenidate Transdermal System treatment if they are not growing or gaining weight as expected.
- **Eye problems (increased pressure in the eye and glaucoma).** Call your healthcare provider right away if you or your child develop changes in your vision or eye pain, swelling, or redness.
- **New or worsening tics or worsening Tourette's syndrome.** Tell your

healthcare provider if you or your child get any new or worsening tics or worsening Tourettes syndrome during treatment with Methylphenidate Transdermal System.

- **Loss of skin color.** Methylphenidate Transdermal System may cause a persistent loss of skin-color where the patch is applied or around the patch application site. Loss of skin-color, in some cases, has been reported at locations on the skin far from any application site. The loss of skin-color may be permanent even after removing the patch or Methylphenidate Transdermal System is stopped. Call your healthcare provider right away if your child has changes in skin-color. Methylphenidate Transdermal System treatment may be stopped if your child has changes in skin color.
- **Allergic skin rash (contact sensitization).** Stop using Methylphenidate Transdermal System and tell your child's healthcare provider right away if your child develops swelling or blisters at or around the application site. Your child may have a skin allergy to Methylphenidate Transdermal System. People who have skin allergies to Methylphenidate Transdermal System may develop an allergy to all medicines that contain methylphenidate, even methylphenidate medicines taken by mouth.

The most common side effects of Methylphenidate Transdermal System in children 6 to 12 years old include:

- decreased appetite
- trouble sleeping
- nausea
- vomiting
- weight loss
- tics
- changes in mood
- trouble eating

The most common side effects of Methylphenidate Transdermal System in children 13 to 17 years old include:

- decreased appetite
- nausea
- trouble sleeping
- weight loss
- dizziness
- stomach pain
- trouble eating

Methylphenidate Transdermal System may also cause skin problems where it is applied (redness, small bumps, itching)

Your child's doctor may do certain blood tests while your child uses Methylphenidate Transdermal System.

These are not all the possible side effects of Methylphenidate Transdermal System. Call your doctor for medical advice about side effects. You may report side effects to FDA at 1-800-FDA-1088.

How should I store Methylphenidate Transdermal System?

- Store Methylphenidate Transdermal System at room temperature between 68° F to 77° F (20° C to 25° C).
- Store Methylphenidate Transdermal System in a safe place, like a locked cabinet.
- Do not store Methylphenidate Transdermal System in the refrigerator or freezer.
- Keep Methylphenidate Transdermal System in their unopened pouches until you are ready to use them.
- Use or throw away the patches within 2 months after you open the sealed tray.
- Dispose of remaining, unused, or expired Methylphenidate Transdermal System by a medicine take-back program at a U.S. Drug Enforcement Administration (DEA) authorized collection site. If no take-back program or DEA authorized collector is available, each unused patch should be removed from its individual pouch, separated from the protective liner, folded in half so that the sticky sides stick together, and flushed down the toilet. Put the pouch and liner in a container with a lid, close the container and throw away the container in the household trash. Do not flush the pouch and liner down the toilet. Visit www.fda.gov/drugdisposal for additional information on disposal of unused medicines.

Keep Methylphenidate Transdermal System and all medicines out of the reach of children.

General information about the safe and effective use of Methylphenidate Transdermal System.

Medicines are sometimes prescribed for purposes other than those listed in a Medication Guide. Do not use Methylphenidate Transdermal System for a condition for which it was not prescribed. Do not give Methylphenidate Transdermal System to other people, even if they have the same symptoms. It may harm them and it is against the law.

You can ask your pharmacist or healthcare provider for information about Methylphenidate Transdermal System that is written for healthcare professionals.

What are the ingredients in Methylphenidate Transdermal System?

Active ingredient: methylphenidate

Inactive ingredients: acrylic adhesive, silicone adhesive

Manufactured for Padagis®, Minneapolis, MN 55427 www.padagis.com

INSTRUCTIONS FOR USE

Methylphenidate (meth-uhl-FEN-i-deyt) Transdermal System CII

1. Methylphenidate Transdermal System Dosing Chart

Each carton of Methylphenidate Transdermal System contains a Methylphenidate Transdermal System Dosing Chart to help you keep track of your Methylphenidate Transdermal System transdermal system (patch) including:

- when you apply patch to the skin on your hip each morning
- when you remove the patch
- how and where you threw Methylphenidate Transdermal System away

To use the Methylphenidate Transdermal System Dosing Chart, follow these instructions:

- Each day, when a new patch is applied to your hip, write down the date and time that you applied the patch.
- Use the Methylphenidate Transdermal System schedule below so you can decide when to remove the patch. For example, if the patch is applied to the skin at 6:00 a.m., remove the patch at 3:00 p.m. on the same day. After you remove and throw away the patch, write down the time you removed the patch and how and where you threw it away.
- If the patch you placed on your child is missing, ask your child:
 - when the patch came off
 - how the patch came off
 - where the patch is

Methylphenidate Transdermal System Schedule for 9 Hour Dosing

If you put the patch on at:	On the same day, remove the patch at:
5:00 a.m.	2:00 p.m.
6:00 a.m.	3:00 p.m.
7:00 a.m.	4:00 p.m.
8:00 a.m.	5:00 p.m.

9:00 a.m.	6:00 p.m.
10:00 a.m.	7:00 p.m.
11:00 a.m.	8:00 p.m.
12:00 p.m.	9:00 p.m.

2. Where to apply Methylphenidate Transdermal System

- Apply patch to your hip area. Do not put the patch near your waist. Clothing and movement may make your patch rub off (See Figure A).
- Use your other hip when you apply a new patch the next morning. Make sure there is no redness, small bumps or itching at the site where the patch is going to be applied.

Figure A

3. Before you apply Methylphenidate Transdermal System

Make sure your skin:

- Is clean (freshly washed), dry, and cool
- Does not have any powder, oil, or lotion
- Does not have any cuts and irritation (rashes, inflammation, redness, or other skin problems).

4. How to apply Methylphenidate Transdermal System

- Open the sealed tray and throw away the small packet (drying agent).
- Each patch is sealed in its own protective pouch.
- Carefully cut the protective pouch open with scissors, being careful not to cut the patch. **Do not use patches that have been cut or damaged in any way (See Figure B).**

Figure B

- Remove the patch from the protective pouch.

- Look at the patch to make sure it is not damaged. The patch should separate easily from the protective liner. Throw away the patch if the protective liner is hard to remove.

Methylphenidate Transdermal System has 3 layers. The 3 layers are pictured below. The pictures show both sides of the patch:

Figure C

Figure D

Layers:

- **Protective liner:** The protective liner is the layer that you remove before you put the patch on (See Figure C).
- **Adhesive with medicine:** The adhesive with medicine is the layer that sticks to your skin (See Figure C).
- **Outside backing:** The outside backing is the layer that you see after you put the patch on your skin. The word "Daytrana" is printed on this layer (See Figure D).
- **Apply the patch right away after you remove the patch from protective pouch.**
- Hold the patch with the hard protective liner facing you. The word DAYTRANA will appear backwards.
- **Gently** bend the patch along the faint line and **slowly peel** half the liner, which covers the sticky surface of the patch (See Figure E).

Figure E

- Avoid touching the sticky side of the patch with your fingers.
- If you accidentally touch the sticky side of the patch, apply the patch, then wash your

hands right away so that the medicine does not go into the skin on your hands.

- Using the other half of the protective liner as a handle, apply the sticky side of the patch to the selected area of the child's hip (See Figure F).

Figure F

- Press the sticky side of the patch firmly into place and smooth it down.
- While you are still holding the sticky side down, gently fold back the other half of the patch.
- Hold an edge of the remaining protective liner and **slowly peel** it off (See Figure G).

Figure G

- After the protective liner is removed, there should not be any adhesive (glue) sticking to the liner.

Figure H

- Press the entire patch firmly into place with the palm of your hand over

the patch for about 30 seconds (See Figure H).

- Make sure that the patch firmly sticks to your skin.
- Gently rub the edges of the patch with your fingers to make sure the patch sticks to your skin.
- Wash your hands after you apply your patch.
- Write the time you applied your patch on the dosing chart on the carton. Use the dosing schedule so you know what time you should remove your patch.

5. How to remove and throw away Methylphenidate Transdermal System

- When you remove the patch, peel it off slowly. If the patch is too sticky on your skin and you need something to help you remove it:
 - Gently apply an oil-based product (petroleum jelly, olive oil, or mineral oil) to the patch edges. Gently spread the oil underneath the patch edges.
 - Apply an oil-based product or lotion to your skin if any adhesive (glue) remains after you remove your patch. This will gently loosen and remove any adhesive that is left over.
 - If you still cannot easily remove the patch, ask your doctor or pharmacist about what to do for this problem.
- Fold the used patch in half and press it together firmly so that the sticky side sticks to itself. **Flush the used patch down the toilet.**
- Do not flush the protective pouches or the protective liners down the toilet. These items should be thrown away in a container with a lid.
- Wash your hands after you handle the patch.
- After you remove the patch and throw the patch away, write down the time on the dosing chart.
- Safely throw away any unused patches that are left over from the prescription as soon as they are no longer needed.

To safely throw away the patches:

- Remove the leftover patches from their protective pouches and remove the protective liners.
- Either fold the patches in half with the sticky sides together, and flush the patches down the toilet, **or**
- Dispose of remaining, unused, or expired Methylphenidate Transdermal System by a medicine take-back program at a U.S. Drug Enforcement Administration (DEA) authorized collection site. If no take-back program or DEA authorized collector is available, each unused patch should be removed from its individual pouch, separated from the protective liner, folded in half so that the sticky sides stick together, and flushed down the toilet. Put the pouch and liner in a container with a lid, close the container and throw away the container in the household trash. Do not flush the pouch and liner down the toilet. Visit www.fda.gov/drugdisposal for additional information on disposal of unused medicines.

Manufactured for Padagis®
