

WESNATE DHA- ascorbic acid, cholecalciferol, .alpha.-tocopherol, d-, thiamine mononitrate, riboflavin, pyridoxine hydrochloride, folic acid, cyanocobalamin, ferrous fumarate, magnesium oxide, zinc oxide, cupric sulfate, and omega-3 fatty acids capsule, gelatin coated
Westminster Pharmaceuticals, LLC

WesNate DHA

Prenatal/Postnatal Prescription Dietary Supplement

69367-317-30

Rx

DESCRIPTION

WesNate DHA is an orally administered prenatal/postnatal prescription dietary supplement with DHA and should be administered under the supervision of a licensed medical practitioner.

DIRECTIONS FOR USE

One softgel daily, regardless of lactation status, or as prescribed by a licensed medical practitioner

Supplement Facts		
Serving Size: 1 Softgel		
Amount Per Serving		% Daily Value for Pregnant and Lactating Women
Vitamin C (as ascorbic acid)	100 mg	83%
Vitamin D (Vitamin D3 as cholecalciferol)	10 mcg (400 IU)	67%
Vitamin E (as d-alpha tocopherol)	20.1 mg (30 IU)	106%
Thiamin (as thiamine mononitrate)	3 mg	214%
Riboflavin	3 mg	188%
Vitamin B6 (as pyridoxine HCl)	20 mg	1000%
Folate	1700 mcg DFE (1 mg Folic Acid)	283%
Vitamin B12 (as cyanocobalamin)	15 mcg	536%

Iron (as ferrous fumarate)	28 mg	104%
Magnesium (as magnesium oxide)	30 mg	8 %
Zinc (as zinc oxide)	20 mg	154%
Copper (as cupric sulfate)	1 mg	77%
Omega-3 Fatty Acids (DHA-EPA)	200 mg	*

* Daily Value not established

Other ingredients: Gelatin, Glycerin, Purified Water, Soy Lecithin, Yellow Beeswax, Soybean Oil, Titanium Dioxide, Natural Creamy Orange Flavor, FD&C Yellow #6, Ethyl Vanillin, FD&C Red #40

KEEP THIS OUT OF REACH OF CHILDREN

CONTRAINDICATIONS

WesNate DHA should not be used by patients with known history of hypersensitivity to any of its ingredients.

WARNING: Accidental overdose of iron-containing products is a leading cause of fatal poisoning in children under 6. KEEP THIS PRODUCT OUT OF REACH OF CHILDREN. In case of accidental overdose, call a doctor or poison control center immediately.

CAUTIONS

High levels of folic acid may, especially in older adults, hide signs of Vitamin B-12 deficiency (such as pernicious anemia, a condition that can cause nerve damage).

Concurrent use of folic acid has been associated with enhanced phenytoin metabolism, lowering the level of the AED in the blood and allowing breakthrough seizures to occur. Caution should be used when prescribing this product among patients who are receiving treatment with phenytoin or other anticonvulsants.

Exercise caution with the concomitant use of folic acid and trimethoprim-sulfamethoxazole for the acute treatment of *Pneumocystis carinii* pneumonia in patients with HIV infection as it is associated with increased rates of treatment failure and mortality in a placebo controlled study.

The action of levodopa is antagonized by pyridoxine.

Products containing iron should not be used during dimercaprol therapy. Dimercaprol can bind to iron and cause kidney damage.

Avoid administering omega-3 fatty acids to patients with inherited or acquired predisposition toward bleeding, including patients taking anticoagulants. Exercise caution with these patients to ensure that the prescribed dosage of DHA does not exceed 1 gram (1000 mg) per day.

Side Effects

Allergic reactions have been reported following oral administration of folic acid.

Iron can cause mild gastrointestinal side effects, particularly when taken on an empty stomach.

DRUG INTERACTIONS

Folic Acid

Concurrent use of folic acid has been associated with enhanced phenytoin metabolism, lowering the level of the AED in the blood and allowing breakthrough seizures to occur.

Folinic acid may enhance the toxicity of fluorouracil.

High levels of folic acid may result in decreased serum levels of pyrimethamine.

Concurrent administration of chloramphenicol and folinic acid in folate-deficient patients may result in antagonism of the hematopoietic response to folate.

Antiepileptic drugs (including, but not limited to, phenytoin, carbamazepine, primidone, valproic acid, fosphenytoin, valproate, phenobarbital and lamotrigine) have been shown to impair folate absorption and increase the metabolism of circulating folate.

Fluoxetine

Fluoxetine exerts a noncompetitive inhibition of the 5-methyltetrahydrofolate active transport system in the intestine.

Decreased folic acid levels have been reported to be associated with the administration of Cholestyramine, Colestipol, Cycloserine, Dihydrofolate Reductase Inhibitors (aminopterin, methotrexate, pyrimethamine, triamterene, and trimethoprim), L-dopa, colchicine, oral contraceptives, methylprednisolone, pancreatic extracts (pancreatin, pancrelipase), prolonged intravenous pentamidine, smoking and alcohol consumption, sulfasalazine, metformin, heme iron, isotretinoin, and after a 6-month course of therapy, warfarin can produce a significant impairment of folate status.

Thiamin (Vitamin B₁)

Furosemide, a loop diuretic, can decrease thiamin levels.

There have been case reports that fluorouracil may increase thiamin metabolism.

Vitamin B₆

Vitamin B₆ should not be given to patients receiving the drug levodopa because the action of levodopa is antagonized by Vitamin B₆. However, Vitamin B₆ may be used concurrently in patients receiving a preparation containing both carbidopa and levodopa.

Isoniazid can produce a Vitamin B₆ deficiency.

Vitamin B₁₂

Antibiotics, cholestyramine, colchicine, colestipol, metformin, para-aminosalicylic acid,

and potassium chloride may decrease the absorption of vitamin B₁₂, and nitrous oxide can produce a functional vitamin B₁₂ deficiency.

Vitamin D₃

Some thiazide diuretics, such as hydrochlorothiazide, as well as antacids, bile acid sequestrants (such as cholestyramine), mineral oil, orlistat, olestra, cimetidine, and anticonvulsant medications may reduce the absorption or increase the catabolism of Vitamin D.

Vitamin D supplementation should not be given with calcium to patients with hypercalcemia or conditions that may lead to hypercalcemia such as hyperparathyroidism or those who form calcium-containing kidney stones.

Iron

Iron supplements might reduce the amounts of levodopa available to the body and diminish its clinical effectiveness.

Levothyroxine ingested simultaneously with iron can result in clinically significant reductions in levothyroxine efficacy.

Proton pump inhibitors reduce the acidity of stomach contents and can reduce iron absorption.

Zinc

Zinc may decrease absorption of quinolone or tetracycline antibiotics.

Cupric oxide

Concomitant use of penicillamine and copper can cause decreased absorption of both substances.

Omega-3 Fatty Acids

Ingestion of more than 3 grams per day of omega-3 fatty acids (ALA, EPA, and DHA) may have potential antithrombotic effects, and may increase bleeding times.

Avoid administering omega-3 fatty acids to patients with inherited or acquired predisposition toward bleeding, including patients taking anticoagulants. Exercise caution with these patients to ensure that the prescribed dosage of DHA does not exceed 1 gram (1000 mg) per day.

PREGNANT AND NURSING MOTHERS

WesNate DHA is a prescription folate dietary supplement formulated for use before, during and/or after pregnancy regardless of lactation status.

KEEP THIS PRODUCT OUT OF REACH OF CHILDREN.

HOW SUPPLIED

WesNate DHA is supplied as oval, orange colored softgel, imprinted with "317"

dispensed in bottles of 30 softgels.

STORAGE

Store at controlled room temperature 15° to 30°C (59° to 86°F).

Protect from light and moisture. Dispense in a tight, light-resistant container.

Call your medical practitioner about side effects. You may report side effects by calling Westminster at 1-844-221-7294 or FDA at 1-800-FDA-1088.
