Always use caution when introducing your cows to a new teat dip.
 Remember these industry guidelines:
 Replace dip cups and/or dip lines
 When introducing new dip to a dairy herd, always replace dip cups and/or brushes to prevent the new dip from mixing with the old dip. If spray or dip pumps are used, lines should be replaced.
 Aggressively remove barns and colored skin from teats
 A temporary exfoliation of dead teat skin is common after new dips are introduced. Be sure to aggressively clean teats to remove exfoliated skin and clean teat ends to insure that the dead skin does not become a barrier to the new dip.
 Monitor cows for changes in skin condition
 Many teat dips are designed with emollients and other skin conditioning ingredients to maintain healthy teat skin and fight germs. Be sure that the new dip is introduced. If unusual skin conditions occur, monitor cows well. If persistent, replace dip with one containing a different germicide and/or emollient formula.

Siempre hacer cuidado al usar un nuevo sellador de pezones en las vacas.
 Tomar en cuenta las siguientes recomendaciones de la industria:
 Usar tazas del sellador limpias y/o limpiar los tubos del rociador del sellador
 Cuando se usa un nuevo sellador de pezones en las vacas, se deben siempre reemplazar las tazas y/o los tubos del rociador del sellador con los nuevos. Si se usan rociadores o bombas selladoras, limpiar los tubos con agua caliente para retirar cualquier residuo del sellador anterior.
 Limpiar fuertemente los pezones para retirar la queratina y las escamas
 Después de introducir un nuevo sellador de pezones, es común que se observe que las vacas pueden formar escamas en la piel. Limpie bien fuertemente los pezones y extremos del pechón para eliminar las escamas en la piel.
 Controlar las vacas y observar los cambios de condición de la piel
 Muchos selladores de pezones están diseñados con emolientes e ingredientes para mantener la salud de la piel para la mastitis y para la destrucción de gérmenes patógenos. Ocasionalmente, se podrán producir reacciones alérgicas o ambivalentes por lo que se debe monitorear a las vacas. Si se observan condiciones de la piel inusuales, monitorear a las vacas bien. Si persisten, reemplazar el sellador con otro que contenga una fórmula con diferente germicida o emoliente.
