Remember these industry guidelines:
Always use caution when introducing your cows to a new product. Replace applicator. When introducing a new solution to a dairy herd, always replace applicator to prevent the new solution from mixing with the old applicator. If pumps are used, these should be flushed with hot water to clean out any residues of the old solution.
Aggressively remove keratin and exfoliated skin from teats
A temporary exfoliation of teat skin is common after new solution are introduced. Be sure to aggressively clean teats to remove exfoliated skin and clean teat ends to insure that the dead skin is removed.
Monitor cows for changes in skin condition
Many solutions are designed with emollients and other skin conditioning ingredients to maintain healthy teat skin and fight germs. Rare teat skin reactions due to allergic or environmental conditions may occur. Closely monitor teat skin whenever a new solution is introduced. If unusual skin conditions are found, monitor closely and, if persistent, replace solution with one containing a different germicide and/or emollient formula.
