-----

Isoflurane Inhalation Anesthetic For Use in Horses and Dogs

#### WARNING

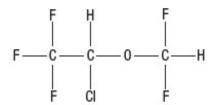

Not for use in horses intended for human consumption. Not for use in Humans. Keep Out of Reach of Children.

#### **CAUTION**

Federal law restricts this drug to use by or on the order of a licensed veterinarian.

#### **DESCRIPTION**

Isoflurane is a nonflammable, nonexplosive general inhalation anesthetic agent. Its chemical name is 1-chloro-2,2,2-trifluoroethyl difluoromethyl ether, and its structural formula is:

Each mL contains 99.9% isoflurane.

Some physical constants are:

Some physical constants are:

Molecular weight ...... 184.5

Boiling point at 760 mm Hg ...... 48.5°C (uncorr.)

Refractive index n20D ...... 1.2990-1.3005

Specific gravity 25°/25°C ...... 1.496

Vapor pressure in mm Hg\*\*

20°C 238

25°C 295

30°C 367

35°C 450

\*\*Equation for vapor pressure calculation: log10 Pv = A + B/(T + C)

A = 8.056

B = -1664.58

 $T = {^{\circ}C} + 273.16$  (Kelvin)

Fairillon Cuenicients at 37 C	Partition	coefficients	at 37°C:
-------------------------------	-----------	--------------	----------

Water/gas	0.61
Blood/gas	1.43
Oil/gas	90.8

Partition coefficients at 25°C - rubber and plas	tic:
Conductive rubber/gas	62.0
Butyl rubber/gas	. 75.0
Polyvinyl chloride/gas	
Polyethylene/gas	
Polyurethane/gas	
Polyolefin/gas	~1.1
Butyl acetate/gas	~2.5
Purity by gas chromatography	>99.9%

Lower limit of flammability in oxygen or nitrous oxide at 9 joules/sec and 23°C ...... None

Lower limit of flammability in oxygen or nitrous oxide at 900 joules/sec and 23°C ........ Greater than useful concentrations in anesthesia

MAC (Minimum Alveolar Concentration) is 1.31% in horses<sup>1</sup> and 1.28% in dogs.<sup>6</sup>.

Isoflurane is a clear, colorless, stable liquid containing no additives or chemical stabilizers. Isoflurane has a mildly pungent, musty, etheral odor. Samples stored in indirect sunlight in clear, colorless glass for five years, as well as samples directly exposed for 30 hours to a 24,000 ft. candle tungsten light, showed no change in composition as determined by gas chromatography. Isoflurane in one normal sodium methoxide-methanol solution, a strong base, for two months contained essentially no alkali, indicative of strong base stability. Isoflurane does not decompose in the presence of soda lime (at normal operating temperatures), and does not attack aluminum, tin, brass, iron, or copper.

#### CLINICAL PHARMACOLOGY

Isoflurane is an inhalation anesthetic. Induction and recovery from anesthesia with isoflurane are rapid.<sup>25</sup> The level of anesthesia may be changed rapidly with isoflurane. Isoflurane is a profound respiratory depressant. RESPIRATION MUST BE MONITORED CLOSELY IN THE HORSE AND DOG AND SUPPORTED WHEN NECESSARY. As anesthetic dose is increased, both tidal volume and respiratory rate decrease.<sup>36</sup> This depression is partially reversed by surgical stimulation, even at deeper levels of anesthesia.

Blood pressure decreases with induction of anesthesia but returns toward normal with surgical stimulation. Progressive increases in depth of anesthesia produce corresponding decreases in blood pressure; however, heart rhythm is stable and cardiac output is maintained with controlled ventilation and normal PaCO<sub>2</sub> despite increasing depth of anesthesia. The hypercapnia which attends spontaneous ventilation during isoflurane anesthesia increases heart rate and raises cardiac output above levels

observed with controlled ventilation.<sup>3</sup> Isoflurane does not sensitize the myocardium to exogenously administered epinephrine in the dog.

Muscle relaxation may be adequate for intra-abdominal operations at normal levels of anesthesia. However, if muscle relaxants are used to achieve greater relaxation, it should be noted that: ALL COMMONLY USED MUSCLE RELAXANTS ARE MARKEDLY POTENTIATED WITH ISOFLURANE, THE EFFECT BEING MOST PROFOUND WITH THE NONDEPOLARIZING TYPE. Neostigmine reverses the effect of nondepolarizing muscle relaxants in the presence of isoflurane but does not reverse the direct neuromuscular depression of isoflurane.

#### CONTRAINDICATIONS

Isoflurane is used for induction and maintenance of general anesthesia in horses and dogs.

#### CONTRAINDICATIONS

Isoflurane is contraindicated in horses and dogs with known sensitivity to isoflurane or to other halogenated agents.

#### WARNINGS

Increasing depth of anesthesia with Isoflurane may increase hypotension and respiratory depression. The electroencephalographic pattern associated with deep anesthesia is characterized by burst suppression, spiking, and isoelectric periods<sup>4</sup>.

Since levels of anesthesia may be altered easily and rapidly, only vaporizers producing predictable percentage concentrations of isoflurane should be used (see **DOSAGE AND ADMINISTRATION**).

The action of nondepolarizing relaxants is augmented by isoflurane. Less than the usual amounts of these drugs should be used. If the usual amounts of nondepolarizing relaxants are given, the time for recovery from myoneural blockade will be longer in the presence of isoflurane than in the presence of other commonly used anesthetics.

Not for use in horses intended for human consumption.

Not for use in Humans. Keep Out of Reach of Children.

#### **PRECAUTIONS**

Isoflurane, like some other inhalational anesthetics, can react with desiccated carbon dioxide ( $CO_2$ ) absorbents to produce carbon monoxide which may result in elevated carboxyhemoglobin levels in some patients. Case reports suggest that barium hydroxide lime and soda lime become desiccated when fresh gases are passed through the  $CO_2$  absorber canister at high flow rates over many hours or days. When a clinician suspects that  $CO_2$  absorbent may be desiccated, it should be replaced before the administration of isoflurane.

Usage in Pregnancy: Reproduction studies have been performed in mice and rats with

no evidence of fetal malformation attributable to isoflurane. Adequate data concerning the safe use of isoflurane in pregnant and breeding horses and dogs have not been obtained.

#### **ADVERSE REACTIONS**

Hypotension, respiratory depression and arrhythmias have been reported.

#### **OVERDOSAGE**

In the event of overdosage, or what may appear to be overdosage, the following action should be taken:

Stop drug administration, establish that the airway is clear and initiate assisted or controlled ventilation with pure oxygen as circumstances dictate.

#### **DOSAGE AND ADMINISTRATION**

Caution: Operating rooms and animal recovery areas should be provided with adequate ventilation to prevent accumulation of anesthetic vapors.

**Premedication:** A premedication regimen, which may be employed depending upon the patient status, to avert excitement during induction, might include an anticholinergic, a tranquilizer, a muscle relaxant, and a short-acting barbiturate.

**Inspired Concentration:** The delivered concentration of Isoflurane should be known. Isoflurane may be vaporized using a flow-through vaporizer specifically calibrated for isoflurane. Vaporizers delivering a saturated vapor which then is diluted (e.g., Vernitrol® vaporizer) also may be used. The delivered concentration from such a vaporizer may be calculated using the formula:

% isoflurane = 100P(y)F(y)

 $F_{(t)}(P_{(a)} - P_{(v)})$ 

Where:  $P_a = Pressure of atmosphere$ 

 $P_v = Vapor pressure of isoflurane$ 

 $F_v = Flow of gas through vaporizer (mL/min)$ 

 $F_t$  = Total gas flow used (mL/min)

Isoflurane contains no stabilizer. Nothing in the drug product alters calibration or operation of these vaporizers.

#### Induction

**Horses:** Inspired concentrations of 3.0 to 5.0% isoflurane alone with oxygen following a barbiturate anesthetic induction are usually employed to induce surgical anesthesia in the horse.

**Dogs:** Inspired concentrations of 2.0 to 2.5% isoflurane alone with oxygen following a barbiturate anesthetic induction are usually employed to induce surgical anesthesia in

the dog.

These concentrations can be expected to produce surgical anesthesia in 5 to 10 minutes.

#### **Maintenance:**

The concentration of vapor necessary to maintain anesthesia is much less than that required to induce it.

**Horses:** Surgical levels of anesthesia in the horse may be sustained with a 1.5 to 1.8% concentration of isoflurane in oxygen.

**Dogs:** Surgical levels of anesthesia in the dog may be sustained with a 1.5 to 1.8% concentration of isoflurane in oxygen.

The level of blood pressure during maintenance is an inverse function of isoflurane concentration in the absence of other complicating problems. Excessive decreases, unless related to hypovolemia, may be due to depth of anesthesia and in such instances may be corrected by lightening the level of anesthesia.

Recovery from isoflurane anesthesia is typically uneventful.<sup>2</sup>

### **HOW SUPPLIED**

Isoflurane is supplied in 250 mL amber-colored bottles.

250 mL bottle package of one

**Storage:** Store at room temperature 25°C (77° F).

#### CONTACT INFORMATION

For inquiries or to report suspected adverse drug experiences, please contact Parnell at 1-800-887-2763 or visit www.parnell.com. For additional information about reporting adverse drug experiences for animal drugs, contact FDA at 1-888-FDA-VETS or online at www.fda.gov/reportanimalae

To obtain a Safety Data Sheet(s), contact Parnell at 1-800-887-2763 or www.parnell.com.
